FIFTY-FIRST

ANNUAL REPORT

OF THE

REGISTRAR-GENERAL

OF

BIRTHS, DEATHS, AND MARRIAGES

IN ENGLAND.

(1888.)

108198

Presented to both Houses of Parliament by Command of Her Majesty.

LONDON:
PRINTED FOR HER MAJESTY'S STATIONERY OFFICE,
BY EYRE AND SPOTTISWOODE,
PRINTERS TO THE QUEEN'S MOST EXCELLENT MAJESTY.

And to be purchased, either directly or through any Bookseller, from
EYRE AND SPOTTISWOODE, EAST HARDING STREET, FLEET STREET, E.C., and
32, ABINGDON STREET, WESTMINSTER, S.W.; or
ADAM AND CHARLES BLACK, 6, NORTH BRIDGE, EDINBURGH; or
HODGES, FIGGIS, & Co., 104, GRAFTON STREET, DUBLIN.

CONTENTS

OF THE

REGISTRAR-GENERAL'S ANNUAL REPORT FOR 1888.

REPORT:—

PAGE

Population. Probable approximate accuracy of official estimate . v

Marriages. Marriage-rate; Relation between Marriage Rate and commercial activity; Forms of Marriage; Increase of Civil and Jewish Marriages; Preference for Marriage by Banns; Previous Civil Condition of Persons married; Ages of Persons married; Signatures in Marriage Registers; Buildings registered for the Solemnisation of Marriages; Certified Places of Worship . . v–viii

Births. Numbers and Rates; Sex; Illegitimate Births . . . viii

Deaths. General death-rate; County death-rates; Sex; Ages; Infant Mortality; Deaths of reputed Centenarians; Urban and Rural Mortality; Registered Causes of Death; Zymotic or Specific Febrile Diseases; Puerperal Fever; Hydrophobia; Parasitic, Dietetic, Constitutional, Developmental, and Local Diseases; Deaths from Violence; Ill-defined and Not-specified Causes; Certification of the Causes of Death . . . . viii–xviii

Progress of Registration. Aggregate Number of Names on the Registers; Number of Searches in the Registers and of Certificates granted at the Central Office xviii

The Army and Navy. Strength and Mortality of the Army at Home and Abroad; Strength and Mortality of the Navy . xviii

Births and Deaths of British Subjects at Sea; Marine Register Book; Mortality of Mercantile Marine . . . xviii–xix

International Vital Statistics. Marriage, Birth, and Death Rates xix

Zymotic Mortality in relation to Sex and Age. Small-pox, Measles, Scarlet Fever, Diphtheria, Whooping-cough, Diarrhœa, Enteric Fever . . . . xix–xxviii

General conclusions on the Incidence of Disease in regard to Age and Sex xxviii

Meteorology; Remarks by James Glaisher, Esq., F.R.S. . . . xxix–xxx

Preliminary Tables . . . . xxxi–lxxxiv

ABSTRACTS:—

Births (distinguishing Legitimate and Illegitimate), Deaths and Marriages Registered in England, and in its Registration Divisions, Counties, and Districts; and Births and Deaths in sub-districts . 1–63

Marriages, Analysis of, in Registration Divisions and Counties; distinguishing the mode of Solemnisation, the number in each quarter of the year, the Previous Civil Condition of Persons married, those not of Full Age, and the Signatures in the Marriage Register 64–67

Ages of Persons married, distinguishing those of Bachelors, Spinsters, Widowers, Widows 68–70

ABSTRACTS—*continued.*

PAGE
Deaths of Males and Females in Public Institutions 71–92
Deaths of Males and Females at different Age-periods in Registration Divisions and Counties 93–103
Causes of Death of Males and Females in England and Wales at different Age-periods 106–119
Causes of Death of Males and Females in London at different Age-periods 120–133
Causes of Death of Males and Females in each Registration County 134–157
Deaths from certain Selected Causes, and Inquest Cases, in Registration Divisions, Counties, and Districts . . 158–190

Deaths from Accident and Negligence, distinguishing Sex, Age, and Cause or Character of Accident 191–197

Deaths from Suicide, distinguishing Sex, Age, and Method . . . 198–199

Deaths from Murder, distinguishing Sex, Age, and Method . . 200–201

Deaths from Manslaughter, distinguishing Sex, Age, and Method . 202–203

Indexes of Registration Districts, Sub-districts, and of certain Towns, referring to Numbers used in the several Tables of Abstracts . . 204–219

General Index to Report and Tables 220–226

REPORT

TO

The Right Honourable CHARLES T. RITCHIE, M.P., President of the Local Government Board, &c. &c.

(1888.)

SIR,

I HAVE the honour to submit to you the following report on the births, deaths, and marriages, registered in England and Wales in the year 1888.

POPULATION.

The population of England and Wales, as enumerated in April 1881, consisted of 25,974,439 persons. The excess of births over deaths from that date to the middle of 1888 was 2,687,242 ; so that the population at the later date, if its growth were determined simply by the balance between births and deaths, would have been 28,661,681. This, however, takes no account of emigration and immigration, and, in the absence of sufficiently full information on these points, the best method of estimating the population is to assume that the rate of growth that existed in the last intercensal period has been maintained in the years that have since elapsed. It was shown in the last Annual Report that this assumption is not likely to lead us far astray, and according to it the population of England and Wales in the middle of 1888 consisted of 28,628,804 persons, of whom 13,931,592 were males and 14,697,212 were females (Table 1). It is on this estimated population that the rates in this report have been calculated.

MARRIAGES.

The marriages registered in 1888 numbered 203,821, giving a rate of 14·2 persons married to 1000 living. The rate in the preceding year, 1887, had also been 14·2, and in 1886 had been 14·1 ; and these three rates are the lowest as yet recorded. (Tables 2 and 3). As a rule in recent years the marriage-rate has gone up or down with the value of British exports, and with the average price of wheat. But in 1888 the value of the exports rose, while the price of wheat fell, and the marriage-rate remained stationary. (Table A.)

TABLE A.—MARRIAGE-RATE, BRITISH EXPORTS and IMPORTS, PRICE of WHEAT, and amount cleared at the London Bankers' Clearing House, 1860–88.*

YEARS.	Marriage-rate.	Value per Head of Population of United Kingdom.			Average Price of Wheat per Quarter.	Amount cleared at the Bankers' Clearing House per Head of Population.

* The figures in the marriage-rate column are not strictly comparable with those in the value columns, inasmuch as the former relate only to England and Wales, while the latter relate to the whole of the United Kingdom. The figures relating to exports and imports are derived from the Board of Trade Statistical Abstracts; and those showing the amount cleared at the London Bankers' Clearing House are calculated upon the population of England and Wales, and are derived from the same source.

Forms of Marriage.—Of the 203,821 marriages contracted in the year, 142,863, or 701 per 1000, were solemnised according to the rites of the Established Church, and 60,958, or 299 per 1000, otherwise. These proportions were precisely the same as in the preceding year 1887; but with that exception the proportion of Church to total marriages was lower than in any previous year. The proportion of Roman Catholic marriages declined, while the proportion of civil marriages advanced slightly, and that of Jewish marriages very considerably, each of these last two proportions being at the highest point as yet reached. (Table 5.) It is to be noted, as pointing to some very great increase in the proportion of Jews in the population, that, while the total marriages in England and Wales increased between 1881 and 1888 by less than 4 per cent., the marriages of Jews, or rather the marriages by Jewish rites, increased no less than 65 per cent.

The increasing preference manifested in recent years among those who are married by the rites of the Established Church to be married after the publication of banns rather than by special or other licence is visible also in the returns for 1888; for of 1000 Church marriages 902 were solemnised after banns, while the average proportion in the ten preceding years had been 880.

First marriages; Re-marriages.—The returns of the civil condition of those who are married show that the decline in the marriage-rate, which began some fifteen years back and has since continued, has been due to a falling off both in the re-marriages and in the marriages between bachelors and spinsters, but that the proportionate decline has been much greater among the former than among the latter; for it will be seen in Table 7, that whereas in 1876 of 1000 men who married 141 were widowers, and of 1000 women 103 were widows, the proportions have gradually fallen until in 1888 they were respectively 119 and 83. Or, to put it in other terms, the marriage-rate, as calculated simply from first marriages, fell between 1876 and 1888 some 12 per cent. both for bachelors and spinsters; while the marriage-rate, as calculated simply from the widowers who re-married, fell 27 per cent., and, as calculated from re marriages of widows, fell 31 per cent.

Re-marriages of Divorced Persons.—The number of persons married in 1888 who were described in the register as having been previously divorced was 178, of whom 82 were men and 96 were women; the numbers of divorced persons married in the three preceding years having been 170, 163, and 173 respectively. Of the 82 divorced men 65 married spinsters, 12 married widows, and 5 married divorced women. Of the 96 divorced women, 70 married bachelors, 21 married widowers, and 5 married divorced men.

Ages at Marriage.—In 10,213, or 5·0 per cent. of the marriages, the ages of both contracting parties were not inserted in the register. It was shown in the 41st Report that the proportion per cent. of marriages in which the ages of both parties were not recorded in the Marriage Register had steadily declined from 40·6 in 1858 to 21·1 in 1878; and since 1878 the decline has continued, the proportion having further fallen to 5·0 per cent. in 1888. The mean age of the 193,608 couples whose ages were stated, was 28·3 years for the men, and 26·0 years for the women. The widowers who re-married averaged 43·8, the widows 40·2, the bachelors 26·3, and the spinsters 24·7 years. These figures showed a very slight increase upon the mean ages of persons married in 1887. The marriages of minors, whether lads or girls, showed a further satisfactory decline, the proportion of such immature unions having been 63 per 1000 for men, and 199 per 1000 for women. We must go back as far as 1860 to find so low a proportion for the men, and to 1863 for so low a proportion among the women. (Table 7.)

Signature in Marriage Register.—In 5991 cases, that is to say in 29 per 1000 marriages, neither bridegroom nor bride could sign the register. This was a marked improvement even upon recent figures; and, if we go back to the earlier years of registration in the table (Table 7), we find that forty years ago in not far short of a quarter of the marriages neither the man nor the woman was able to write.

Buildings registered for the Solemnisation of Marriages.—There were, at the end of 1888, 14,923 Churches or Chapels belonging to the Established Church in which marriages could be solemnised, showing an increase of 56 upon the number at the end of the preceding year. The number of buildings registered for marriages by other rites than those of the Established Church standing on the register at the end of 1888 was 10,116 (Table 9), showing an increase in the course of the year of 182, or 1·8 per cent. upon the number on the register at the end of 1887.

Certified Places of Worship.—At the end of 1887 there were on the register 25,330 places of worship not belonging to the Established Church, certified for religious worship under Acts 15 & 16 Vict. c. 36, and 18 & 19

Vict. c. 81. During the year 1888 748 new buildings were registered, while 117 were removed from the register by cancellation; thus the net increase during the year was 631, and the number on the register on the 31st of December 1888 was 25,961. There are grounds, however, for believing that some of the buildings standing on the register are no longer used, although no steps have been taken to remove them from the register by cancellation.

BIRTHS.

The births registered in 1888 numbered 879,868, and were in the proportion of 30·6 to 1000 persons living. This is the lowest birth-rate recorded in this country since civil registration began, with the exception of the first year of registration, 1838, when the system was not yet in thorough working order, and the births that remained unregistered were doubtlessly very numerous. The birth-rate has fallen continuously since 1876, when it was 36·3 and at its maximum.

The rate varied in the registration counties from 24·2 in the little county of Rutland, 25·2 in Sussex, and 25·5 in North Wales, to 34·1 in Durham, and 35·4 both in Essex and in Monmouthshire. In every county, with the single exception of Essex, the rate was below the average of the preceding decennium; but the estimates of the populations of single counties so many years after the last enumeration are of course somewhat doubtful, and very possibly the apparent exceptional increase in the birth-rate, in the case of Essex, may be due to an under-estimate of the growth in that county since 1881. (Table 10.)

Sex.—The male births numbered 447,172, and the female births 432,696, the former being to the latter in the proportion of 1033 to 1000, the proportion in the preceding decennium having been 1038. In no previous year was the proportion of male to female births so low as in 1888.

Illegitimate Births.—The infants registered as born out of wedlock numbered 40,730, and were 4·6 per cent. of the total births, the proportion being lower than in any preceding year (Table 2). It is satisfactory to note that, though the marriage-rate has declined persistently for many years, and with it of course the legitimate birth-rate, the illegitimate birth-rate has also persistently declined, and in 1888 was only 1·4 per 1000 living persons. The registration counties in which the proportion of illegitimate to total births was highest were Norfolk, Herefordshire, Shropshire, Cumberland, and North Wales, all of these habitually showing similarly high proportions. (Table 10.)

DEATHS.

The deaths registered in the year numbered 510,971, and were in the proportion of 17·8 to 1000 persons living. This is far the lowest death-rate as yet recorded, the next lowest being 18·8, the rate recorded in the immediately preceding year 1887. In each of the eight years of the current decennium the death-rate has been under 20·0, whereas in no single previous year had it ever fallen so low. The average in the eight years has been only 19·05, having in the next preceding decennium, 1871–80, been 21·38.

It will be shown in the following paragraphs, in what counties, in which sex, at what ages, and under what diseases the great fall in 1888 occurred.

County death-rates.—The rate in 1888 was only 14·3 in Surrey (extra-metropolitan) and 14·6 in Sussex, and was under 16·0 in Kent, Berkshire, Huntingdonshire, Worcestershire, Rutlandshire, and Westmorland; while in only one county did it rise as high as 20·0, namely in Lancashire, where the rate was 20·2. In every county, with one exception, the rate was below the previous decennial average; the exception was Dorsetshire, where the rate was the same as the previous average; that average, however, being one of the very lowest. (Table 10.)

Sex.—The 510,971 deaths included 263,294 of males and 247,677 of females. The death-rate of males was 18·8, and that of females 16·8 per 1000 living of each sex respectively, showing a decline for each sex of 10 per cent. from the average rate of the immediately preceding ten years 1878–87.

Out of equal numbers living there were 1121 deaths of males to 1000 deaths of females, a difference somewhat greater than in any of the three next preceding years (Table 2), and slightly exceeding the decennial average.

Ages at Death.—In Tables 11–14 are given the death-rates at different ages for each sex; and, if the figures for 1888 be compared with those for previous years, it will be seen that, though the mortality declined at almost every age, yet the main diminution was in the periods of infancy and childhood. The rate in the first age-peried, 0–5 years, was for boys 15, and for girls 16 per cent. below the average in the preceding ten years; and among children in the second age-period, 5–10 years, the decline was 22 per cent. for boys, and 20 per cent. for girls; all these declines being greater than the falling off in the general death-rate at all ages, which, as stated in the last paragraph, was only 10 per cent. for each sex. The year 1888 was thus clearly especially favourable to infants and children, and, as will be seen later on, the favourable condition consisted in the coolness of the summer months which checked infantile diarrhœa, and the mildness of the winter months which checked infantile bronchitis.

The proportion of deaths of infants in the first year of life to the registered births, or the infantile mortality, which is largely influenced by the amount of summer diarrhœa, was 136 deaths to 1000 births, and, as may be seen in Table 18, the proportion has only twice been lower than this, namely in 1879 and in 1881, each of which years was also distinguished by exceptionally low diarrhœa mortality.

In almost every county (Table 10) the infantile mortality was considerably below the decennial average; but the rate varied from 87 in Westmorland, 95 in Herefordshire, and 100 in Dorsetshire, to 154 in the West Riding, 159 in Lancashire, 162 in Staffordshire, and 163 in Leicestershire, all these latter being counties in which the infantile mortality is invariably in excess.

It will be noticed that in this Report the deaths of infants in the first year of life have for the first time been sub-divided and shown for shorter sub-periods (pp. 106–133).

Among the deaths were 69 of reputed centenarians, 19 being men and 50 being women. A large share of these aged persons was as usual contributed by Wales.

Urban and Rural mortality.—The urban death-rate is invariably in excess of the rural death-rate; but the effect of sanitary measures has been to reduce the difference between the two very considerably. Both have fallen, but the urban rate more than the rural. In the three successive decennial periods, 1851–60, 1861–70, 1871–80, for every hundred deaths in the rural districts there were, out of equal numbers living, 124, 126, and 122 deaths in the urban population. But since 1880 only on one occasion, namely in 1882, has the proportion been so high as 120, and in 1888 it fell to 110, the minimum yet reached. (Table 24.) This is in great part attributable to the cool summer and consequent comparative absence of infantile diarrhœa, which is a disease of towns rather than of rural districts, and which causes the excess of urban over rural mortality to be much greater in the third than in any other quarter of the year.

REGISTERED CAUSES OF DEATH.

The assigned causes of death were distributed as follows in the several classes :—

TABLE B.—MORTALITY FROM THE SEVERAL CLASSES OF DISEASES.

Causes of Death.	Total Deaths 1888.	Rate per Million living.								
		1883.	1887.	1886.	1885.	1884.	1883.	1882.	1881.	Mean 1871-80.
Zymotic diseases - -	60,166	2,097	2,660	2,648	2,507	3,094	2,639	3,088	2,660	3,724
Parasitic diseases - -	709	25	29	35	30	38	39	37	39	57
Dietetic diseases - -	1,779	62	63	59	59	58	66	68	66	63
Constitutional diseases -	89,332	3,111	3,166	3,330	3,276	3,404	3,407	3,395	3,328	3,594
Developmental diseases -	44,293	1,543	1,555	1,618	1,598	1,574	1,632	1,558	1,582	1,674
Local diseases - -	272,026	9,479	9,720	9,915	9,908	9,543	9,890	9,591	9,348	9,920
Violence - - -	17,534	611	642	626	625	651	675	669	697	736
Ill-defined and not specified causes - -	25,132	871	955	1,047	1,007	1,149	1,188	1,154	1,160	1,610
All causes - -	510,971	17,799	18,790	19,278	19,010	19,511	19,536	19,560	18,880	21,378

Zymotic or Specific Febrile Diseases.—The deaths ascribed to this class of specially preventable diseases numbered 60,166, and were in the proportion of 2097 to a million persons living. This rate was far lower than that recorded in any previous year in the current decennium, and no less than 44 per cent. below the mean rate in the preceding decennium, 1871–80.

It will be seen on reference to Table 16, that the decline in mortality was shared by all the diseases in this class, with the single exception of diphtheria ; the rate under each other heading in the group having been considerably below the previous decennial average, and, in the majority of cases, if not actually at the minimum point yet attained, not far above it.

The deaths from *small-pox* were 1026, and in the ratio of 36 per million living, a ratio somewhat higher than that in either of the two next preceding years, but lower than the decennial average, which had been 54. To the 1026 deaths ascribed to *small-pox* may be added 116 ascribed to *chicken-pox*, and not improbably cases of mistaken small-pox ; with this addition the rate instead of being 36 would still have only been 40.

Of the 1026 deaths ascribed to small-pox 91 were certified to have been of vaccinated and 269 to have been of unvaccinated persons, while concerning the remaining 666 there was no information.

Of the 1026 deaths no less than 409, or two-fifths of the whole, occurred in Sheffield with Ecclesall Bierlow. There were also minor outbreaks in Preston (52 deaths), Bristol and Clifton (47 deaths), Caistor (48 deaths), Ashton-under-Lyne (34 deaths), and Chesterfield (30 deaths).

The deaths from *measles* were 9784 and in the proportion of 341 per million living. This is the lowest rate recorded in any year since 1881, when the rate was only 280, and contrasts strongly with the rate in the immediately preceding year 1887, which was 594 and the highest, with the exception of 1839, on record. The exceptionally low rate in 1888 was probably to a considerable extent due to the excessive prevalence of the disease in 1887, which had left comparatively few children unprotected by previous attack. There were, however, some registration counties in which the measles mortality in 1888 was anything but low. Thus in Staffordshire the deaths per million living were 825, in Monmouthshire 747, in Dorsetshire 649, in London 565, in Gloucestershire 513, in Bedfordshire 455, and in Lancashire 427; and it is to be noted that in some of them, namely, the industrial counties of Stafford, Monmouth, London, and Lancaster the measles death-rate is almost always in excess. (Table 23.)

The deaths from *scarlet-fever* numbered 6378, and were in the proportion of 222 to a million living. For four successive years, 1885–88, the rate has been below 300, a level to which it had never fallen in any single preceding year. In 1874 the rate was 1051, and from that date has fallen almost uninterruptedly year after year. So persistent a decline can scarcely be explained by referring it to the casual fluctuation to which all the zymotic diseases are subject, and seems to point to some persistent improvement in the conditions on which the prevalence of this disease depends; and not improbably one such improvement consists in the extended facilities for isolation provided by sanitary authorities; and the greater care taken by school managers to exclude children coming from infected houses. The highest rates in the registration counties were 350 in Derbyshire, 362 in the West Riding, 387 in Lancashire, and 513 in South Wales, all of these being mining or industrial counties. (Table 23.)

The deaths ascribed to *typhus* numbered 160, being in the proportion of only 6 to a million living. This is the lowest typhus rate on record; the rate having fallen uninterruptedly, with the exception of a slight recrudescence in 1874, and again in 1882–83, from 193 per million in 1869, when the distinction of typhus from other fevers was first made in these annual reports, to the present insignificant figure. Doubtlessly much of this decline is due to the stricter use of the term typhus, which in earlier years was used frequently for any form of severe febrile attack; but the experience of our hospitals shows that this is not the whole explanation, and that there has been, for some reason or other, an extraordinary diminution, amounting almost to complete disappearance, of this species of continued fever. As has been several times pointed out in former reports it is in the northern counties that this disease still maintains a position; for out of the 160 deaths in all England and Wales, 10 occurred in Cheshire, 12 in the West Riding, 21 in Durham, and 67 in Lancashire; of these last, 35 occurred in Liverpool and the immediately surrounding districts, 15 in Manchester, Salford, and Prestwich, while the remaining 17 were scattered among the other registration districts of the county.

The deaths from *enteric fever* numbered 4848, being in the ratio of 169 per million living; while the deaths ascribed to simple or to ill-defined forms of continued fever were 436, or 15 per million living. These two rates, as that from typhus, were the lowest on record. Taking the 8 years of the current decennium, the mean annual rates have been 201 per million living for enteric and 28 for simple or ill-defined fever, while the average rates in the next preceding decennium had been 326 and 105 respectively. As the conditions under which outbreaks of enteric fever occur are more thoroughly known than those which bring about typhus, there seems no reason why we should not hope that this disease also may, like typhus, before many years practically disappear from the death account. The enteric fever rate in 1888 was less than 100 per million living in the counties of Surrey (extra-metropolitan), Sussex, Herts, Oxon, Bedford, Cambridge, Wilts, Dorset, Cornwall, Hereford, Rutland, and Cumberland; while it exceeded 200 in the counties of Northampton, Leicester, Lincoln, Nottingham, Derby, Chester, and Lancaster, the former being all rural and the latter, with one exception, industrial counties. (Table 20.)

Under *whooping-cough* 12,287 deaths were registered in the year, being 428 per million of the estimated population. This rate was somewhat, but not much, below the average, the mean rate in the ten preceding years, 1878–87, having been 490. This disease of children is much less amenable to sanitary interference than are most other zymotics, and the mortality from it has consequently been comparatively little reduced. The mortality was higher among girls than among boys, the rate under five years of age having been 3314 per million for the former and only 2780 per million for the latter; and it will be seen later on, when the age and sex incidence of zymotic diseases comes under consideration, that this higher mortality of girls is in accordance with the habitual incidence of this disease.

In the registration counties the rate varied from 17 per million in Herefordshire, 29 in Monmouthshire, and 85 in Cornwall, to 516 in Norfolk, 545 in Leicestershire, 576 in Staffordshire, 697 in London, 740 in Essex, 746 in Cumberland, and 934 in Middlesex (extra-metropolitan). (*See* Tables 20 and 23.)

The deaths registered under the heading *diphtheria* numbered 4815, being in the proportion of 168 per million living. With the single exception of 1884, the mortality from this disease had not been so high as this for more than 20 years. The differences of opinion as to what forms of throat affections should be termed diphtheritic doubtlessly make the mortality figures under this heading somewhat untrustworthy; still an examination of the figures for successive years, as given in Table 16, leaves but little room for doubt that this affection is on the increase, the registered rate having averaged 156 per million in the eight years of the current decennium, against an average of 121 in the next preceding decennial period.

It was pointed out in the 47th Annual Report (p. xiii), that an examination of the death-rates in the separate counties for a succession of years led to the conclusion that there are in this country two tolerably definite areas in which diphtheria apparently finds its most suitable home, and these areas were for convenience styled respectively the South-eastern and the Welsh diphtheritic regions. If the rates for 1888, as given in Table 20, be examined, it will be seen that of the sixteen registration counties in which the diphtheria mortality in that year exceeded the rate for the whole country no less than twelve form a compact area in the South-eastern district, while of the counties in or about the western district only one, namely, Monmouthshire, showed a similar excess. The remaining three counties, which form no part of either diphtheritic region, but nevertheless had in 1888 rates above the general average, were Lancashire, Devonshire, and Dorsetshire.

The deaths from *diarrhœa*, including *dysentery*, numbered 12,839, being in the proportion of 447 to a million living. This was not only far below the average, the mean annual rate in the immediately preceding ten years having been 749 per million, but was lower than the rate recorded in any one of the preceding forty years.

Of these 12,839 deaths, 8212 were of infants in the first year of life; and, comparing this figure with the births registered in the year, it will be found that the infantile diarrhœa deaths were in the proportion of 9333 to a million births, the proportion having been 16,355 in 1871–80, and 13,949 in 1881–87.

The diarrhœa mortality is mainly determined by the summer temperature, and the exceptionally low death-rate of 1888 is ascribable to the exceptionally low temperature of July and August, the mean temperature at Greenwich in these two months having been 57°·9 and 59°·1 respectively, against an average in 100 years of 61°·6 and 60°·8.

It is more striking, however, to compare 1888 with the immediately preceding year 1887, because the general sanitary conditions can hardly have changed much in these two contiguous years, and therefore any great difference in the diarrhœa mortalities can safely be attributed to other than sanitary causes. In 1887 the proportion of infantile deaths from diarrhœa to registered births was 15,909 per million, while in 1888 it was only 9333. But in 1887 the mean temperatures in June, July, and August were respectively 60°·9, 66°·5, and 62°·5; while in 1888 they were 58°·3, 57°·9, and 59°·1; a difference, taking the whole period of these months, of almost five degrees of Fahrenheit, so that those five degrees of extra heat in the summer of 1887 cost between six and seven thousand deaths of infants from bowel complaints per million registered births.

Puerperal Fever.—The deaths thus described were 2386, and, adding to these 1774 deaths from the other accidents of childbirth, we have a total of 4160 directly ascribed to parturition. This was in the proportion of 4·73 deaths to 1000 registered births, a rate somewhat higher than the previous decennial average, which had been only 4·51. The childbirth mortality was, as usual, much higher in Wales, and especially in North Wales, than in the English counties. (Table 23.)

Hydrophobia.—There were but 14 deaths ascribed to this disease in the year, being a smaller number than in any year since 1868. (Table 15.) Of these 14 deaths, 5 occurred in Lancashire, and 6 either in London or the immediately adjoining counties, while there was one apiece in Wiltshire, Cumberland, and Glamorganshire.

The great interest attaching to this disease makes it worth while to supplement the somewhat minute examination to which its statistics were subjected in the 48th Annual Report by a Table showing the geographical distribution of the deaths caused by it in the 20 years 1869–88. The number of deaths is too small to give a sufficient basis for calculation of trustworthy rates for each separate county. But by grouping these as is done in Table C., a somewhat better basis can be obtained.

TABLE C.—DEATHS AND AVERAGE ANNUAL DEATH-RATE FROM HYDROPHOBIA IN GROUPS OF COUNTIES, 1869–88.

COUNTIES.	Enumerated Population, 1881.	Deaths 1869–88.	Annual Deaths per Million living.
London - - - -	3,816,483	121	1·59
Middlesex (ex.met.) - - Surrey (ex.-met.) - - - Kent (ex.-met.) - - -	1,550,395	45	1·45
Sussex - - - - Hampshire - - - Berkshire - - - -	1,317,495	24	0·91
Hertfordshire - - - Buckinghamshire - - Oxfordshire - - - Northamptonshire - - - Huntingdonshire - - - Bedfordshire - - - Cambridgeshire - - -	1,215,445	23	0·95
Essex - - - -	552,268	9	0·81

TABLE C.—*Continued.*

COUNTIES.	Enumerated Population, 1881.	Deaths 1869–88.	Annual Deaths per Million living.
Suffolk Norfolk	791,256	5	0·32
Wiltshire Dorsetshire Devonshire Cornwall Somersetshire	1,859,013	25	0·67
Gloucestershire Herefordshire Shropshire Worcestershire	1,292,215	12	0·46
Warwickshire	730,531	6	0·41
Leicestershire Rutlandshire Lincolnshire	812,709	8	0·49
Staffordshire	1,006,758	26	1·29
Nottinghamshire Derbyshire	825,156	32	1·94
Lancashire	3,485,819	236	3·39
Cheshire	622,365	30	2·41
West Riding	2,197,999	107	2·43
North Riding East Riding	696,760	17	1·22
Durham Northumberland	1,309,252	35	1·34
Cumberland Westmorland	314,961	2	0·32
Monmouthshire Wales	1,577,559	17	0·54

It appears from the Table that hydrophobia has in this country two centres, from which it radiates into the surrounding districts.

The more important of these two centres consists of the county of Lancaster, where the annual mortality is 3·39 per million, and far higher than in any other part of the country whatsoever. From Lancashire the disease radiates into the contiguous counties of Chester and the West Riding, in which the rate is 2·43, and higher than anywhere else, excepting of course Lancashire itself. Then come the next adjoining counties on the south and east of these, namely, Derbyshire and Nottinghamshire, with a rate of 1·94; and then a further ring, consisting of Northumberland, Durham, North and East Riding, and Staffordshire, with rates varying from 1·22 to 1·34. The arrangement, which is of course best seen by duly shading an outline map, is so definite, that no reasonable doubt can exist that Lancashire is the central point from which the disease starts, and that the other counties in the North are affected in proportions determined by their respective proximities to that centre. It is, however, to be noted that there is no radiation apparently into Westmorland and Cumberland, notwithstanding their proximity to Lancashire. Possibly their exceptional exemption may be explicable on geographical grounds, such as the presence of physical barriers and the comparative absence of great open lines of communication between the main part of Lancashire and these small mountainous counties.

The second centre consists of London, where the rate is 1·59 and higher than in any of the southern counties. From London the disease spreads into the extra-metropolitan portions of the three metropolitan counties of Middlesex, Surrey, and Kent, in which the rate is 1·45; and then into the wider belt of counties round these, Sussex, Hampshire, Berkshire, Oxfordshire, Buckinghamshire, Hertfordshire, Bedfordshire, Cambridgeshire, and Essex.

This geographical distribution of hydrophobia in man tallies very closely, as might be expected, with the distribution of rabies in animals. For it appears from the last report of the Agricultural Department of the Privy Council (page 151) that "there are two groups of counties or districts in " which this malady is chiefly localised and where it may be said to be " enzootic. The first comprises the counties of Chester, Lancaster, York " (West Riding), Stafford, and Derby;—the second includes the Metro- " polis and the adjoining counties of Middlesex, Essex, Kent, Surrey, and " Sussex." It would be of much interest to know whether these two centres of rabies and hydrophobia are distinguished from the rest of the country in the number or character of the dogs that inhabit them.

Parasitic diseases.—Of the total 709 deaths in this class, 54 were ascribed to Hydatids, the average annual number in the seven earlier years of the current decennium having been 53; to worms and other animal parasites were ascribed 109 deaths, the average in the preceding seven years having been 131; vegetable parasites were credited with seven deaths, while the remaining 539 were ascribed to the very unsatisfactory heading thrush. It is, however, a sign of improving statement of causes by medical men that the deaths thus inadequately described are year by year falling off in number. In 1888 they were fewer than ever before, and the rate for the whole class fell in consequence to its minimum, being no more than 18 to a million living.

Dietetic Diseases.—The deaths in this class, in which intemperance is the chief heading, were 1779, and in the proportion of 62 per million living, a rate scarcely differing from the average of recent years.

Constitutional Diseases.—The deaths in this class numbered 89,332, being 3111 per million living, and fewer in proportion to the population than in any previous year of the current decennium, or than in the preceding decennial period. The decline was due to the further falling off in the mortality from phthisis and other tubercular diseases, which was at its minimum; while there was, as usual, a slight increase under cancer, and diabetes remained at the same point as had been reached in the previous year, that point being its maximum. The mortality from rheumatic fever and from rheumatism remained very nearly at the level of recent years. (Table 16.)

Developmental Diseases.—The deaths thus classed numbered 44,293, being 1543 per million living, a rate slightly, but not materially, lower than that recorded in any other year in the Table (Table B.). The main heading in the class is Old Age, and under this there was a slight further decline, attributable probably to the more precise designation of the causes of death of aged persons. The deaths from premature birth, which is the only other considerable heading in the class, were in the proportion of 15·98 deaths to 1000 registered births.

It has been pointed out in former reports, and the fact is of sufficient importance to deserve being again noticed, that the proportion of premature births, or rather of deaths so described, to total births, is constantly increasing, and though the deaths ascribed to congenital malformations have not increased to an equal extent, yet here also there appears to be a tendency to rise; and in 1888 the mortality under each of these headings reached its maximum, as the following table shows.

TABLE D.—PREMATURE BIRTHS AND CONGENITAL MAL-FORMATIONS. DEATHS TO 1000 BIRTHS, 1861–1888.

YEAR.	Premature Births.	Congenital Mal-formations.
1861–65	11·19	1·76
1866–70	11·50	1·84
1871–75	12·60	1·85
1876–80	13·38	2·39
1881	13·63	3·20
1882	13·99	3·31
1883	14·45	3·08
1884	14·42	3·15
1885	14·43	3·41
1886	15·09	3·33
1887	15·89	3·29
1888	15·98	3·45

Local Diseases.—The deaths in this class numbered 272,026, and were in the proportion of 9479 to a million living, a rate which though not actually the lowest shown in Table B., for it exceeded the rate in 1881, was nevertheless below the average of recent years. The decline was under diseases of the nervous system, of the liver and digestive organs, and of the respiratory system, these latter having probably fallen off in consequence of the mildness of the winter months; for the year 1888 had not only a remarkably cool summer, which diminished the diarrhœa mortality, but also a remarkably mild winter period. On the other hand there was a further slight increase in the mortality from the diseases of the circulatory system, and the deaths from urinary diseases remained practically at the level of recent years.

Violence.—The deaths ascribed to some or other form of violence numbered 17,534, and were in the proportion of 611 to a million living. Both the deaths from accident or negligence and the deaths from homicide were fewer in proportion to the population than in any previous year (Table 16), the rate for the former being 519 and for the latter 10 per million living. On the other hand the deaths from suicide, 2308 in number, were relatively more numerous than they had ever been before, being 81 to a million living.

The deaths from homicide include all those in which a jury has returned a verdict either of murder or manslaughter. Doubtlessly the line between the two is very vague; and consequently in the 49th Annual Report (p. xxi), when the age and sex liabilities to these forms of violent death were considered, the two were taken together. Still, as the deaths ascribed to manslaughter purport to be due to unintentional killing, while in those ascribed to murder the intention was held to be the destruction of life, it may be of interest to examine what ages and which sex are most liable to murder. The following table gives the experience of 25 years, namely, 1863-1887.

TABLE E.—DEATHS AND DEATH-RATES OF MALES AND FEMALES FROM MURDER AT DIFFERENT AGE PERIODS, PER MILLION LIVING, 1863–1887.

AGES.	Murders.		Annual Rates per Million living, 1863-87.	
	Males.	Females.	Males.	Females.
All Ages	**2,656**	**2,658**	**9**	**9**
0—	1,626	1,629	178	180
1—	51	55	6	7
2—	32	38	4	5
3—	24	30	3	4
4—	15	25	2	3
Total under 5	1,748	1,777	43	43
5—	59	70	2	2
10—	27	25	0·8	0·8
15—	65	52	2	2
20—	122	105	5	4
25—	208	219	5	5
35—	179	187	5	5
45—	113	115	5	4
55—	71	58	4	3
65—	39	35	4	3
75 and upwards	25	15	7	3

It will be seen from the Table that more than 60 per cent. of the deaths from murder are cases of infanticide, murders of infants in the first year of life. The first year passed, the chances of murder decrease year by year through infancy and childhood, till a minimum is reached about the close of the fifteenth year. Then the rate again rises, and having after a few years reached some 5 per million remains pretty much the same throughout the rest of life. There is very slight difference in the respective liabilities of the two sexes; but, so far as conclusions can be drawn from such scanty data, there appears to be a slightly greater tendency to destroy female infants and very old men, rather than male infants or aged women.

Ill-defined and Not-specified Causes.—The deaths in this unsatisfactory class numbered 25,132, being 4·9 per cent. of all the deaths registered. This shows a further improvement in the certification of causes of death, the average percentage in the preceding years of the current decennium having been 5·7. It was, however, found necessary to send no less than 3370 letters of inquiry to medical practitioners, asking for further particulars as to causes of death that had been indefinitely stated. The result of this laborious work was to add 367 deaths to the heading cancer, 301 to puerperal fever and accidents of childbirth, and varying numbers to other definite headings.

Certification of the Causes of Death.—During the year 1888 the causes of 466,646, or 91·3 per cent. of the 510,971 deaths, were certified by registered medical practitioners; and the causes of 28,578, or 5·6 per cent., were certified by coroners after inquest. The causes of 15,747, or 3·1 per cent. of the total deaths, were not certified, the proportion of uncertified deaths having steadily declined from 4·7 per cent. in 1879 to 3·3 per cent. in 1887. The proportion of uncertified deaths as usual varied very considerably in different parts of England and Wales. In the county of London the proportion in 1888 did not exceed 1·0 per cent. The lowest percentages of uncertified deaths in the other counties were 0·9 in

Middlesex, 1·1 in Surrey, 1·2 in Wiltshire, 1·3 in Monmouthshire, and 1·4 in Sussex; while the highest percentages were 4·4 in the West Riding, 4·5 in Derbyshire, 4·6 in Cornwall, 4·7 in Herefordshire, 4·8 in Kent, 5·0 in Durham, and 6·4 in Huntingdonshire. In Wales the percentage of uncertified deaths was 6·9, being 8·7 in North Wales, and 6·1 in South Wales.

PROGRESS OF REGISTRATION.

The number of names added in 1888 to the alphabetical indexes of births, deaths, and marriages recorded in the national register of England and Wales was 1,798,481. At the close of the year the aggregate number of names in these indexes, which embraced a period of 51½ years, was 77,554,236. The total number of searches in 1888 in the various registers was 40,477, showing an increase of 2727 upon the number in the previous year. The number of certificates issued was 30,053, and 2565 more than in 1887. The amount received as fees for searches and certificates in the year 1888 and paid into Her Majesty's Exchequer was 5,808*l.* 0*s.* 6*d.* an increase of 460*l.* 15*s.* 6*d.* upon the amount in the previous year. (Table 26.)

A list of the various public registers and records lodged in the General Register Office, Somerset House, was published in the 34th Annual Report, pp. xxi–xxii and xxv–xxvi.

MORTALITY IN THE ARMY.*

The average strength of the Army, at home and abroad, in 1888, was 211,105, and the deaths were 2041, so that the rate of mortality was 9·7 per 1000; in the two preceding years the rates had been 13·8 and 9·6. The mortality in the army abroad was 12·6 per 1000, whereas it had averaged 15·3 in the five preceding years; the rate at home was 6·8, corresponding with the rate in the preceding quinquennium. (Table 29.)

MORTALITY IN THE NAVY.†

The average force afloat in 1888 was 50,060. The deaths were 286, being in the ratio of 5·71 per 1000 of the strength. Of the 286 deaths, 198 were due to disease, and 88 (including 8 from heat-stroke) to violence; so that the death-rate from disease was 3·95 and from violence 1·76 per 1000.

Of the 88 deaths from violence 35 resulted from accidental drowning, 44 from other accidental causes, and 9 from suicide.

BIRTHS AND DEATHS OF BRITISH SUBJECTS AT SEA.

Marine Register Book.—In accordance with the Births and Deaths Registration Act of 1874, commanding officers of British ships not in Her Majesty's service, are required, under a penalty, to transmit returns of all births and deaths occurring on board their ships to the Registrar-General of Shipping and Seamen, who furnishes certified copies of such returns to the Registrars-General of England, Scotland, and Ireland. Returns of a similar character are also received from the commanding officers of Her Majesty's ships. These certified copies of entries of births and deaths at sea constitute the "Marine Register Book." During the year 1888 the entries added to this Register related to 232 births and to 3374 deaths. Of these 3374 deaths, 1486 were of persons returned as of English origin, while 499 were indefinitely returned as of persons of "British" origin.

---

* Based upon returns furnished by His Royal Highness the Commander-in-Chief.

† From data supplied by the Director-General of the Medical Department of the Navy.

Among *passengers* on board merchant vessels at sea (Table 32), 129 births and 447 deaths were reported in 1888, showing a decline of 15 births and of 423 deaths, as compared with the numbers in 1887.

Mercantile Marine.—The Registrar-General of Shipping and Seamen reports that the number of masters and of merchant seamen afloat in registered vessels belonging to the United Kingdom, including the islands in the British Seas, during 1888 was 223,673, showing an increase of 3407 upon the number in the preceding year. The reported deaths among these masters and merchant seamen during 1888 were 3114, and were equal to an annual rate of 13·9 per 1000 of the strength; this was 1·5 below the rate in 1887, and was lower than the recorded rate in any recent year.

INTERNATIONAL VITAL STATISTICS.

In Tables 39–56 will be found international vital statistics relating to most of the principal European States, including the United Kingdom. Table 39 affords the means for comparing the marriage, birth, and death-rates in each State in a series of years with the mean rate during the period 1861–80. Tables 40–56 give detailed statistics for the United Kingdom and its several parts, and for the other European States.

The *marriage-rates* in 1888, with the exception of a further increase in Belgium, scarcely differed from those recorded in 1886 and 1887. The mean rate in the nine European States furnishing returns was 15·2 per 1000, and exceeded the rate in the United Kingdom by 1·9. The rates in the various States ranged from 12·3 in Norway and 13·8 in the Netherlands, to 15·8 in Austria and 16·1 in Prussia.

The *birth-rates* showed a further general decline in the European States, the mean rate being 32·8, which exceeded the rate in the United Kingdom by 3·2. The rates in the various States ranged from 23·1 in France and 27·7 in Switzerland, to 36·6 in Italy, 36·7 in the German Empire, and 37·9 in Austria.

The *death-rates*, compared with those in 1887, showed an increase in Denmark, Norway, Austria, the Netherlands, and Belgium, whereas they declined in the other States. The mean rate of mortality in the nine European States furnishing returns was 24·3 per 1000, and exceeded the rate in the United Kingdom by no less than 6·5. The rates in the various States ranged from 16·9 in Norway and 19·7 in Denmark, to 23·8 in the German Empire, 26·8 in Italy, and 29·2 in Austria. It should be remembered, however, that, in order to make these crude death-rates strictly comparable, due correction should be made for the variations in the proportional age-distribution of the several populations.

ZYMOTIC MORTALITY IN RELATION TO SEX AND AGE.

In the last Annual Report (pp. xxi–xxxiv) statistics, based upon the enormous mass of data that have accumulated in the General Register Office since its establishment half a century ago, were given as to the age and sex incidence of a considerable number of fatal diseases. How wide was the basis upon which these statistics were founded may be judged from the fact that the rates of mortality at the several age-periods and in the two sexes for phthisis were calculated from not far short of two million recorded deaths from that disease. In the diseases examined in that report the main zymotic affections were not included, partly for want of space, and partly because those zymotic affections require a somewhat different mode of investigation; for as several of them are mainly, though not exclusively, destructive in the earlier years of life, it becomes necessary in their case to split up the first age-period, 0–5 years, into single-year periods, and further, if possible, to divide the first year itself into shorter sub-divisions of time.

It will, however, be convenient first of all to give a Table (Table F) for these zymotics drawn up on the same plan as was used for the other diseases, and to show in a separate Table (Table G) the further sub-divisions of the first age-period. As in the corresponding Table in the former Report, the second column in Table F gives the period over which the observations have extended, while the third gives the total number of observations that have accumulated in that period. Columns 5–15 give the annual death-rates at eleven successive age-periods per million living at each such period; while in column 4 are given the annual rates per standard million, that is for a million males and females having identically the same age-distribution, this distribution being that given at p. xxi of the last Report.

It will be noted that with the single exception of enteric fever, all the diseases in the Table are diseases that are pre-eminently, though not exclusively, fatal in the first five years of life, and that the only diseases of which the very high rate of mortality extends beyond that first age-period are scarlet-fever, diphtheria, and, as already mentioned, enteric fever. It is this, as before explained, that makes it advisable to split up the first age-period into single years. But it must be remembered that death-rates calculated for single years of life are far less trustworthy than those calculated for quinquennial or decennial periods, inasmuch as neither the living population nor the number of deaths can be ascertained with anything like so great accuracy as is possible for the longer periods. For, when a child is stated by its parents to be three years old, we may feel assured that it comes well within the 0–5 age-period, but can by no means feel equally certain that the parent may not have meant "in its third year of life" and not "three at its last birth-day." At the same time the effect of this uncertainty must not be exaggerated; and the rates may, in spite of it, be accepted as approximately correct.

Small-pox.—The mortality from small-pox was considered at length in the 43rd Annual Report, and it was there shown how enormously, not only the aggregate death-rate from this disease, but the relative mortality at different age-periods, had been altered concurrently with the increasing use of vaccination. The average rates therefore for 1854–87 given in Table F differ very widely from the rates if calculated for a shorter and more recent period. But as there is no reason to suppose that vaccination is neglected more commonly in one sex than the other, the rates in the Table may be safely used for comparison between males and females in regard to their liability to death from small-pox. The Tables show that throughout life, with the exception of the 2nd and 3rd years and of one later quinquennium, the mortality of males exceeds that of females, and this in a very high degree, and that, taking all ages together, the average annual male rate has been 183 and the average annual female rate 148 per standard million. The exceptional quinquennial period is the 10–15 years period, when the female slightly exceeds the male mortality, being also very little behind it in the next quinquennial age-period. This, however, is simply an instance of what is observable in many other diseases, namely that, at a stage of life when important organic changes are going on in the female body, the mortality of females rises to a much higher level as compared with that of males than at the other periods of life. The excess on the female side in the 2nd and 3rd years is but very slight, and, did it stand as an isolated fact, might be attributed to the comparative untrustworthiness of rates calculated for single-year periods. But, on looking at the figures for other diseases it will be seen that several of them present somewhat analogous features.

TABLE F.—AVERAGE ANNUAL DEATH-RATES FROM THE CHIEF ZYMOTIC DISEASES PER MILLION LIVING AT SUCCESSIVE AGE-PERIODS, AND PER STANDARD MILLION AT ALL AGES (in continuation of Table C. in 50th Annual Report, pp. xxii–iv).

DISEASE.	Period taken for Calculation.	Number of Deaths in Period.		Annual Mortality per Million living.											
				ALL AGES. (Standard Million.)	Under 5 Years.	5–	10–	15–	20–	25–	35–	45–	55–	65–	75 and upwards.

Thus, under diarrhœa, measles, diphtheria, and enteric fever, though the male mortality in the first two years is in excess, a change sets in in the third year, and the female rate becomes the higher. The general explanation appears to be that the first year of life, and in a smaller degree also the second, is pre-eminently dangerous to male children, who from a pathological point of view are weaker than girls of corresponding age, and, if not more liable to be attacked by most illnesses, are at any rate more likely to succumb to them. These first years of life over, the two sexes for the rest of early childhood stand more on an equality; and, more of the weakly males having already succumbed, there may perhaps now be even some slight inferiority on the side of the girls.

The much greater mortality from small-pox of males than of females seems to have escaped the notice of most writers on this disease, who speak of the two sexes as equally susceptible to attack, and do not state such attacks to be more fatal in the one than in the other sex. But the basis (128,025 deaths) on which the rates in Tables F. and G. are based is so large, and the difference in the rates is so great, that it is impossible to question the reality of the fact, that for some reason or other the male mortality from small-pox far exceeds that of females. There are two possible explanations, namely, greater susceptibility to attack on the part of males, or greater chance of an attack in their case proving fatal. Not improbably both explanations are concurrently admissible; for, judging from such imperfect data as are furnished by the reports of our public small-pox hospitals, not only do the male cases admitted far outnumber the female cases, but a much larger proportion of them terminate in death.

Measles.—There is reason to believe that all ages and both sexes are equally liable to be attacked by this disease, for, when after an absolute immunity of many years, a case of measles was introduced into the Faroe Islands, the infection spread to all persons without exception, saving some few aged persons who had had an attack in their early childhood and were consequently protected. But in this country, where the virus is always present, so very large a proportion of the population is attacked in infancy or childhood that the number remaining unprotected at more advanced ages is comparatively small. Thus the disease appears to be almost limited to childhood, and the mortality of course follows the same limitation. Whether any part, and, if so, how great a part, in the low mortality of the more advanced ages is due to diminished case-mortality at such ages, there are unfortunately no means of deciding, in the absence of sufficiently ample records of cases.

Limiting ourselves, therefore, to the mortality figures, we find that the death-rate from measles is at its maximum for each sex in the second year of life, and then falls rapidly, year by year, until, after childhood is past, it becomes insignificant. Taking the whole of life the aggregate mortality is somewhat higher for males than for females, the mean annual deaths per standard million having been 426 for the former and 408 for the latter in the forty years 1848-87. But it is curious that this excess on the side of males is entirely due to their higher mortality in the first two years of life, and that at each later year in the first quinquennium and in each later age-period, the female mortality is the higher. These excesses on the female side are not very large, but are sufficiently so to be unmistakeable; and their being maintained regularly, age-period after age-period, leaves no doubt that they are not casual but the outcome of some persistent law.

Scarlet Fever.—The statistics of scarlet fever were examined in great detail in the 49th Annual Report (pp. xiii–xviii), and it will, therefore, be unnecessary to do more on the present occasion than quote the conclusions to which that elaborate inquiry led. They were as follow:—

1. The mortality from this disease is at its maximum in the third year of life, and after this diminishes with age, at first slowly, afterwards rapidly.
2. This diminution is due to three contributory causes; (*a*) the increased proportion in the population at each successive age-period of persons protected by a previous attack; (*b*) the diminution of liability to infection in successive age-periods of those who are as yet unprotected,; (*c*) the diminishing risk in successive age-periods of an attack, should it occur, proving fatal.
3. The liability of the unprotected to infection is small in the first year of life, increases to a maximum in the fifth year or soon after, and then becomes rapidly smaller and smaller with advance of years.
4. The chance that an attack will terminate fatally is highest in infancy, and diminishes rapidly to the end of the twenty-fifth year, after which an attack is again somewhat more dangerous.
5. The female sex throughout life, the first year possibly excepted, is more liable to scarlet fever than is the male sex.
6. But the attacks in males, though fewer, are more likely to terminate fatally.

Diphtheria.—It is scarcely to be doubted that the returns of deaths under this heading are untrustworthy, there being apparently no thorough consensus among medical practitioners as to the precise use of the term, and especially there being a difference in opinion as regards its relation to croup. Not infrequently it has been found that, there being an outbreak of sore-throats in some district, the deaths in one medical man's practice are returned as due to diphtheria, in another's as due to soré-throat, and in another's pérhaps to croup. On this account the figures for croup have been put in the two previous Tables side by side with those for diphtheria, although croup, in accordance with the classification of the College of Physicians, does not find its place in these Reports among the zymotic affections, but among diseases of the respiratory system. A comparison of the figures under the two headings in Tables F. and G. will, however, sufficiently show, that, though there may be considerable confusion and an absence of any very clear line of demarcation between the deaths ascribed to croup and those ascribed to diphtheria, the two names can scarcely be regarded as mere aliases for one and the same affection. For while the mortality under croup is throughout considerably higher among boys than among girls, the mortality under diphtheria after the first two years of infancy is much higher in the female sex, diphtheria being the only zymotic disease, with the exception of whooping-cough, to which females furnish, out of equal numbers living, more victims than do males.

The mortality from diphtheria rises to its maximum about the fourth year of life, and then falls in each successive age-period with the exception of an insignificant rise in old age.

Sufficient data are unfortunately not to be found for determining whether the higher death-rates of females and of the young are explicable by higher case-mortality; that is to say, whether, and to what extent, an attack of diphtheria is more likely to terminate fatally in a female than in a male, and in a child than in an adult; but it appears from such data as are procurable * that the susceptibility to attack among those living in cottages where the disease is present is very much greater for females than for males, and for those under than for those over 20 years of age; and further that in the first two years of life the susceptibility is not so great as somewhat later on; so that the mortality figures in Tables F. and G. show at any rate a general correspondence with the observed facts as to susceptibility.

---

* Cf. St. George's Hosp. Reports, 1877–78., ix. 717–8.

Whooping-cough.—The mortality from this affection is at its maximum in the first year of life, in which respect whooping-cough resembles diarrhœa and small-pox, but differs from measles, scarlatina, diphtheria, and enteric fever, all of which reach their maxima in a later year. The first year passed, the mortality from whooping-cough falls gradually year by year, and after the tenth year becomes quite insignificant. Whooping-cough presents this peculiarity, which, however, is shared in a smaller degree by diphtheria, that it is more destructive to females than to males, the mean annual mortality per standard million being 554 for the former, and only 451 for the latter sex. Moreover, if we put aside those advanced age-periods when the deaths are too few to give a safe basis for calculation, the excess on the female side shows itself at each successive age-period; and this is the only zymotic disease in which such a condition of things presents itself.

There are unfortunately no adequate data available for determining whether the greater mortality of the female sex is due to greater liability to attack, or to higher case-mortality. It appears, however, to be the opinion of medical authorities, that girls are much more liable than boys to contract this ailment.*

Diarrhœa.—Of all the affections included in the above Tables the most destructive is diarrhœa, with which is comprised dysentery. These bowel affections are most fatal at the two extremes of life, and especially in infancy, the mean annual mortality in the first year of life having been in the forty years, 1848–87, no less than 18,972 per million living among male infants and 15,899 per million among girls. After the first year of life the mortality falls very greatly and diminishes continuously until a minimum is reached in the 10–15 years period, after which it again rises slowly but uninterruptedly, age-period after age-period, to the end. In the first year of life, and also in old age, the male exceeds the female mortality, but in the intervening age-periods there is no such very marked difference between the sexes, and in the child-bearing periods, from 15 to 45 years, the mortality is distinctly higher among females. But as the first year and old age are the periods when diarrhœa is by far the most fatal, the total mortality of males at all ages is considerably in excess of the female mortality, the annual deaths averaging 932 for the former and only 835 for the latter, per standard million.

Enteric Fever.—It is highly probable that a large proportion of the deaths ascribed to enteric fever among infants and very young children are in reality not due to that disease, but to some undetected cause manifesting itself in feverish symptoms; for there appears to be a very general consensus among the best authorities, that true enteric fever is very rare among children in the first two years, and uncommon even in the third and fourth years of life. Taking, however, the figures as they stand, the registered mortality from this disease is at its minimum, for each sex, in the first year of life, after which it rises and remains high for the remaining years of the first quinquennial period, so that the annual rate in the aggregate quinquennium is high, 303 for males and 312 for females per million.

After this first period is over, the rate falls not inconsiderably for males, but quite insignificantly for females, until the 15th year of life has been completed, when the rate again rises, reaches a maximum in the 20–25 years period, and then falls to remain comparatively low through the remaining age-periods.

The aggregate rate for all ages is somewhat, but very slightly, higher for males than for females, being 288 for the former and 277 for the latter per standard million; and this excess on the side of males is the more noticeable inasmuch as an attack of this fever is on the whole somewhat more likely to prove fatal in the case of females than in the case of males.*

---

* Cf. Barthez et Rilliet., ii., 644. Steffen in Ziemssen's Cyclop., vi., 717.

But though the male death-rate from enteric fever at all ages in the aggregate exceeds that of females, this is by no means the case at each separate age-period. On the contrary the female mortality is very considerably the higher from the third year of life until the end of the twentieth.

Is this higher death-rate of females at these ages due to greater liability on their part to contract the disease, or to its being in their case more often fatal? The latter appears to be the case, as is shown in the following Table (Table H.), in which the number of deaths per million in each sex at each age-period is multiplied by the number of cases to one death, as deduced from the records of the London Fever and Metropolitan Asylum Hospitals. The Table shows that so far from females between 5 and 20 years of age being more liable than males to attacks of enteric fever, their liability is considerably less; and that it is the more dangerous nature of the attack, or in other words the higher case-mortality, and not a greater number of attacks, to which the excessive female death-rate at these age-periods is due. The Table, though the case-mortality is only based on 5716 recorded attacks, which doubtlessly is scarcely a sufficiently wide foundation, shows clearly enough how dangerous it is to draw inferences as to the liability of different ages and sexes to any given disease merely from the mortality figures.

TABLE H.—ENTERIC FEVER.—AVERAGE ATTACKS TO ONE DEATH; AND ESTIMATED ANNUAL ATTACKS AT SUCCESSIVE AGE-PERIODS PER MILLION LIVING AT EACH SUCH PERIOD.

AGES.	MALES.			FEMALES.		
	Annual Deaths per Million living.	Average Cases to one Death. (London Hospitals.)	Estimated Annual Cases per Million living.	Annual Deaths per Million living.	Average Cases to one Death. (London Hospitals.)	Estimated Annual Cases per Million living.
0 —	303	6·08	1,842	312	8·33	2,599
5 —	264	13·79	3,641	304	9·58	2,912
10 —	250	11·19	2,798	310	5·54	1,717
15 —	353	6·27	2,213	389	4·49	1,747
20 —	395	4·49	1,774	302	5·69	1,718
25 —	301	3·64	1,096	253	4·77	1,207
35 —	240	3·57	857	217	4·47	970
45 & upwds.	253	2·19	554	205	4·79	982

In dealing with the zymotic diseases in Table G., the first quinquennium has been broken up into single-year periods. The first year of life, however, with its excessively high death-rate, is of such importance that it will be worth while attempting to sub-divide it into still shorter periods. But before so doing, it is necessary to repeat, and even with greater emphasis, the caution already given as to single-year periods, namely that the shorter the age-period for which rates are calculated the less trustworthy are the results. The differences, however, in the rates in the several sub-divisions of the first year, as shown in the following Table, are as a rule so very great, that, when every allowance has been made for possible and probable inaccuracies, some most certain inferences may be drawn without risk of error. It has not been thought worth while to calculate the rates separately for males and females. The figures, therefore, are for all infants irrespective of sex.

---

* This statement is based on the results of 5716 cases collected from successive reports of Metropolitan Hospitals. It was found that the case-mortality for males was 171 per 1000 and for females 188 per 1000; and this result tallies pretty closely with that of medical writers. Thus the cases collected by Murchison gave him a mortality for males of 177, and for females of 189 per 1000 cases.

TABLE I.—DEATH-RATES FROM VARIOUS CAUSES OF INFANTS IN SUB-PERIODS OF THE FIRST YEAR OF LIFE, 1852–70 AND 1881–7.

CAUSES OF DEATH.	Annual Rates per Million.		
	Under Three Months.	Three Months and under Six Months.	Six Months and under One Year.
All Causes - - -	313,429	129,234	105,428
Small-pox - - -	1,573	890	790
Measles - - - -	384	835	4,881
Scarlet Fever - - -	303	688	2,349
Diphtheria - - -	320	304	632
Whooping-cough - -	4,560	6,144	8,123
Fever - - - -	384	581	784
Diarrhœa - - -	20,996	20,138	11,860
Erysipelas - - -	1,905	774	268

The most noticeable feature in this table is that though the annual mortality of infants from all causes is far higher in the first three months of life than in the next quarter, and in this again than in the remaining six months of the first year, the contrary is the case as regards most of the zymotic diseases, the annual mortality increasing with the advance of age, and being especially low in the first three months. This is the case with Measles, Scarlet Fever, Diphtheria, Whooping-cough, and Fever, from all of which diseases very early infancy appears to enjoy a marked degree of immunity. But the figures for Small-pox, for Diarrhœa, and for Erysipelas contrast in the most striking way with these: for under each of those headings the mortality is highest in the first three months, and declines very greatly after that age.

As regards Small-pox the probable explanation of this is to be found in the fact that the proportion of infants who are protected by vaccination is comparatively small in the first three months, and increases with the advance of age. As regards Erysipelas, under which somewhat vague name are probably included a variety of skin affections, the fact that the mortality is enormously greater in the first three months than later on is scarcely compatible with the opinion, sometimes put forth, that the mortality of infants from this affection is in large measure due to vaccination; for the excess is at the period when vaccination is least common, and the mortality largely decreases when the usual time for vaccination has arrived. There remains Diarrhœa; here there is no very great difference of rates between the first and the second three months, in each of which short periods the mortality is enormously high; but these two sub-divisions of the first year contrast in a remarkable degree with the third and latest sub-division, in which the mortality falls off by not far short of 50 per cent. And this is the more noteworthy, inasmuch as it appears to be the belief of those who have given attention to the subject, that diarrhœa is more common among infants who have been weaned than among those who are still at the breast. If this be so, the necessary inference appears to be, that diarrhœa, though less frequent among infants in the first six months of life than among those somewhat older, is nevertheless so much more likely to prove fatal to them, that the comparative paucity of attacks is much more than counterbalanced.

The age and sex incidence of the chief diseases in our Tables has now been pretty fully considered, and from the accounts given in the present and the last Reports it will be sufficiently clear that before any satisfactory answer can be returned to the question, whether any given disease is more fatal in the one than in the other sex, it is absolutely necessary to take age into account. There are, it is true, some diseases among those to which both sexes are liable, that are at every age-period more destructive to one sex than the other. Such, for instance, are gout, carbuncle, alcoholism, diabetes, fistula, pleurisy, aneurism, calculus, cystitis, and generally diseases of the urinary organs, which at each age-period carry off more males than females; such also are cancer, chorea, and gallstones, which are practically at all ages more destructive to women. But in the majority of cases, one and the same disease is more fatal at some ages in one sex, and at other ages in the other. As instances may be cited phthisis, apoplexy, syphilis, erysipelas, and hernia; to which may further be added several others, which, though at most age-periods they carry off annually more males than females, yet in the exceptional period of puberty reverse the order of fatality, and are more destructive to the female sex; such are pneumonia, bronchitis, and generally diseases of the respiratory organs, and such also are pericarditis and rheumatic fever.

If a simpler answer as to the respective mortalities of the two sexes be required, the only way to obtain it is, as has been previously explained, to apply the death-rates for each sex at the successive age-periods to a male and female population in which the age distribution is identical; and, when this is done, it is found that the annual mortality in almost all cases is higher in the male than in the female sex, the only, or almost the only, exceptions to this rule being cancer, chorea, gallstones, peritonitis, diphtheria, and whooping-cough, under each of which headings the female mortality is the higher. Among the other diseases the excess on the male side is sometimes comparatively slight, as in enteric fever, measles, scarlet fever, diseases of the digestive organs, syphilis, and rheumatic fever, under none of which headings is the excess as much as ten per cent.; but there are other headings under which the male rate is from two to five times, or in one instance as much as nine times, as high as the female rate. Such are alcoholism, gout, carbuncle, aneurism, fistula, calculus, cystitis, and generally diseases of the urinary organs, and such also are accident and suicide.

I have the honour to be,
Sir,
Your faithful Servant,
BRYDGES P. HENNIKER,
Registrar-General.

General Register Office, Somerset House,
30th November 1889.

REMARKS ON THE METEOROLOGY OF THE YEAR 1888.*

BY JAMES GLAISHER, ESQ. F.R.S., &c.

The following remarks, both with regard to atmospheric pressure and temperature, are based on the observations made near London, but they may be taken as having a general application.

Atmospheric Pressure.—The readings of the barometer were generally above their averages till the 9th of February, being particularly so from the 9th to the 13th of January, when they were about three-quarters of an inch above their averages, the mean daily excess for the 40 days being 0·28 in.; from February 10th to the 22nd they were below, the mean daily deficiency being 0·22 in.; from February 23rd to March 2nd they were above, the mean daily excess being 0·16 in.; from March 3rd to the 31st they were below, particularly so on the 11th, 28th, and 29th days, when they were over an inch below their averages, the mean daily deficiency for the 29 days being 0·43 in.; from April 1st to June 4th they were generally for a few days together above or below their averages and nearly to the same value; from June 5th to July 31st they were generally below, the mean daily deficiency being 0·14 in.; from August 1st to October 30th they were generally above, the mean daily excess for these 91 days being 0·12 in.; from October 31st to November 14th they were below, the mean daily deficiency being 0·21 in.; from November 15th to the 25th they were above, the mean daily excess being 0·16 in.; and from November 26th to the end of the year they were generally below, the mean daily deficiency for these 36 days being 0·08 in.

The highest reading of the barometer in the year at the height of 150 feet above the sea was 30·54 ins. on January 11th, and the lowest was 28·54 ins. on March 28th; the yearly range was therefore 2·00 ins.

Temperature.—The temperature of the air was generally below its average till the 12th of April, being particularly so on the 1st and 30th of January; on the 2nd, and from the 22nd to the 29th of February; on the 1st, 2nd, 17th, 18th, 19th and 20th of March; and from the 4th to the 10th days of April, the deficiency below the average of each of these days being nearly 10° or more than 10°, the mean daily deficiency for the 103 days ending April 12th being 4°·1; from April 13th to the 18th it was above, the mean daily excess being 2°·7; from April 19th to May 16th it was below, the mean daily deficiency being 2°·5; from May 17th to the 21st it was above, being particularly so on the 19th day, when it was 12½° above its average, the mean daily excess being 4°·8; from May 22nd to the 31st it was below, the mean daily deficiency being 3°·6; from June 1st to the 4th it was above, particularly so on the 3rd day, when it was 10½° above its average, the mean daily excess being 5°·8; from June 5th to August 6th it was generally below, particularly so from the 17th to the 20th of June, and on the 11th and 12th of July, when it was 16°·5 and 15°·1 respectively below the average, the mean daily deficiency for the 63 days ending August 6th being 4°·7; from August 7th to 12th it was above, the mean daily excess being 4°·8; from August 13th to October 24th it was generally below, particularly so from the 1st to the 9th of October, the mean daily deficiency for these 9 days being 13°·4; and the mean daily deficiency for the 73 days ending October 24th being 3°·6; from October 25th to December 8th it was generally above, being particularly so on the 27th and 28th of October, on the 16th and 25th of November, and on the 5th and 6th days of December, and on all these days it was over 10° above the average, the mean daily excess for the 45 days ending December 8th being 3°·6; from December 9th to 18th it was below, being as much as 12°·8 below on the 10th, and 11°·2 on the 18th; the mean daily deficiency being 8°·6; and from December 19th to the end of the year it was above, the mean daily excess being 2°·5.

---

* For Meteorological Tables, *see* pp. lxiv–lxix.

The highest temperatures of the air were 87°·7 at the Royal Observatory, 87° at Cambridge, and 86°·5 at Royston; and the lowest were 11°·5 at Somerleyton, 12°·5 at Carlisle, and 12°·6 at Bath.

Rainfall.—The falls of rain were below their average in January and February, and above in March. The total fall in the three months at Greenwich was 4·56 ins., being 0·42 in. below the average. The falls of rain were below their average in April and May, and above in June. The total fall for the three months at Greenwich was 5·50 ins., being 0·28 in. below the average. The falls of rain for July and August were above their average, and below in September. At Greenwich the total fall in these three months was 11·21 ins., being 3·93 ins. above the average. The fall of rain for October was below the average, above for November, and below for December. At Greenwich the total fall for these three months was 6·22 ins., being 0·89 in. below the average. The fall of rain for the year was 27·49 ins., being 2·34 ins. above the average; and the number of days on which it fell was 167.

The heaviest falls of rain at our stations in the year were at Bath 41·34 ins., at Truro 40·94 ins., and at Plymouth 37·00 ins.

The least falls were at Cambridge 18·94 ins., at Nottingham 20·00 ins., and at Royston 21·62 ins.

The greatest numbers of days of rain were 229 at Guernsey, 223 at Salisbury, and 213 at Stonyhurst; and the smallest numbers of rainy days were 153 at Cambridge, 159 at Royston, and 160 at Rugby.

Thunderstorms occurred on 60 days at the different stations during the year; of these, 16 took place in July, 12 in June, 10 in August, 5 in both March and November, 4 in May, 4 in September, 3 in April, and 1 in October, and none were reported in January, February, or December.

Thunder was heard but lightning was not seen on 63 days during the year; of these, 14 were in July, 12 in August, 11 in June, 7 both in May and September, 3 in November, and 2 both in March and October.

Lightning was seen but thunder was not heard on 42 days during the year; of these, 11 were in August, 8 in June, 5 in both July and September, 4 in November, 3 in May, 3 in October, and 1 in each of the months of March, April, and December.

Solar halos were seen on 92 days during the year; of these, 13 were in June, 11 in both April and August, 9 in July, 8 in each of the months of March, May, and November, 7 in both October and December, 4 in September, 3 in January, and 2 in February.

Lunar halos were seen on 32 days during the year; of these, 7 were in November, 5 in December, 4 in both January and March, 3 in both August and October, 2 in July, and 1 in each of the months of February, April, June, and September.

Snow fell on 86 days during the year; of these, 25 were in March, 23 in February, 14 in April, 13 in January, 5 in October, 4 in November, and 1 in both May and July; the last fall in the spring was May 2nd, at Halifax, none fell in June, August, September, or December; and the first fall in the autumn was on the 1st of October.

Hail fell on 92 days during the year; of these, 15 were in February, 14 in March, 12 in April, 9 in both January and November, 7 in both May and July, 5 in both August and October, 4 in June, 3 in September, and 2 in December.

Fog prevailed on 174 days during the year; of these, 22 were in October 20 in each of the months of January, September, and December, 17 in June, 15 in November, 12 in March, 11 in both February and July, 10 in April 9 in May, and 7 in August.

---

* The populations used are deduced from the rates of increase observed in the 40 years 1841–81 (*see* Table 1), and are distributed in the several groups of ages according to the proportions found to prevail at the last five Censuses.

Table 12.—ENGLAND.—Annual Death-rates at Twelve Groups of Ages, 1839–88,*—Females.

* Deaths from this cause prior to 1881 were classed, partly with "Diseases of Respiratory System" and partly with "Ill-defined and not specified Causes."
† Deaths from these diseases prior to 1881 were classed with "Other Tubercular and Scrofulous Diseases."

TABLE 16.—ENGLAND.—Annual Death-rates, from Various Causes, to a Million Persons living, 1864–88.

(Decimals are omitted, the nearest whole number being taken. When the Deaths from any Cause were too few to give a rate of 0·5, a cipher is inserted.)

NOTE.—*Up to and including* 1886 masters were excluded from the above employment and mortality figures; the latter of which contained some cases of men who died in colonial vessels and fishing vessels not registered under the Merchant Shipping Acts, whose crews are not included in the employment column.
Since 1886 masters are included in both columns, and the employment and mortality figures relate only to persons employed in registered vessels belonging to the United Kingdom, the Isle of Man, and Channel Islands.

* The prices of Consols for the years 1839–52 relate to the 12 months beginning 1st April; from 1853 onwards the prices relate to calendar years.

† The prices of coal in 1849–81 are derived from a Parliamentary Return (No. 25, 1881) furnished by the Registrar of the London Coal Market, by order of the House of Commons: the quotations for 1882–88 are derived from quarterly averages supplied to the Registrar-General by the Mineral Statistics Department, Home Office.

‡ Derived from Returns, published by the Local Government Board, of the number of persons in receipt of Relief on the last day of each week.

INTERNATIONAL VITAL STATISTICS.

TABLE 39.—Persons Married, Births, and Deaths per 1000 of the Population, in the UNITED KINGDOM and in OTHER EUROPEAN STATES.

(Tabulated from returns furnished by the authorities of the various States.)

YEAR.	UNITED KINGDOM.	ENGLAND AND WALES.	SCOTLAND.	IRELAND.	DENMARK.	NORWAY.	SWEDEN.	AUSTRIA.	HUNGARY.	SWITZERLAND.	GERMAN EMPIRE.	PRUSSIA.	THE NETHERLANDS.	BELGIUM.	FRANCE.	ITALY.

NOTE.—The population in the four years 1862-65 and in the years 1867–69 is estimated by means of the average annual rate of increase observed between the two enumerations of 1861 and 1866. The deaths of Frenchmen abroad, civil or military, are registered in the books of the Commune in which they were last domiciled.

* Census year.

† Cholera prevailed in 1865-66, and war raged in 1870 and 1871.

NOTE.—Statistics for the 7 years 1871-77 were not issued owing to the disturbed state of the country. The decline in registered marriages in 1870 is believed to be due to the introduction of civil registration, which occurred in that year.

* Censuses were taken on 31st December 1860, 1866, and 1877.

NOTE.—The numbers for Rome were first included with those for the Kingdom of Italy in 1872. The population figures given for census years show the numbers enumerated on 31st December in each of those years; whereas for each of the other years the population is estimated to the middle of the year. The populations in inter-census years are somewhat over-estimated, no account having been taken of emigration.

* Census year.

TABLE 57.—ENGLAND. **Changes** in the **Constitution** of **Registration Districts** and **Sub-districts** during the Year **1888.**

N.B.—(1.) The Name of the District is in SMALL CAPITALS, that of the Sub-district in *Italics*.
(2.) The Populations quoted are the Numbers enumerated at the Census of 1881.

No. of District.	NAME OF REGISTRATION DISTRICT.	Date of Change.	Nature of Change.
69	BATTLE	1888. 1 April	The parish of Westfield (population 1,051) was transferred from the sub-district of *Bexhill* to that of *Ewhurst.*
69	BATTLE	1 July	The sub-district of *Battle* (aggregate population 5,395) was dissolved, and of the five parishes formerly comprised therein, one, viz., the parish of Battle (population 3,319), was transferred to the sub-district of *Ewhurst,* which was re-named *Battle,* and the remaining four parishes, viz., Brightling, Dallington, Ashburnham, and Penhurst (aggregate population 2,076) were transferred to the sub-district of *Bexhill.*
148	THAME	1 April	The parishes comprising this district were re-arranged, and the number of sub-districts reduced from three to two, the sub-district of *Brill* having been abolished. The two sub-districts are constituted as follows: *Lewknor* sub-district, in addition to the fourteen parishes formerly constituting the sub-district (aggregate population 3,500), now comprises the five parishes of Tetsworth, Ashton Rowant, Crowell, Sydenham, and Emmington (aggregate population 1,625), which formerly belonged to *Thame* sub-district, and the three parishes of Albury, Tiddington, and Waterstock (aggregate population 339), which formerly belonged to *Brill* sub-district. *Thame* sub-district now comprises four parishes formerly belonging thereto, viz., Attington, Thame, Towersey, and Kinsey (aggregate population 3,881), and ten parishes which were formerly comprised in *Brill* sub-district, viz., Long Crendon, Chilton, Dorton, Brill, Oakley, Worminghall, Ickford, Shabbington, Waterperry, and Thomley (aggregate population 4,517).
254	ALDERBURY	1 June	The parishes comprising this district were re-arranged, and the number of sub-districts reduced from four to three, the sub-district of *Britford* having been abolished. The three sub-districts are now constituted as follows, viz., *Alderbury* sub-district, in addition to seven parishes formerly belonging thereto, viz., Alderbury, Clarendon Park, East Grimstead, West Grimstead, Farley with Pitton, Winterslow, and West Dean (aggregate population 2,968), also comprises five parishes which were formerly comprised in *Britford* sub-district, viz., Laverstock, Milford, Fisherton Anger, Old Sarum, and Stratford under the Castle (aggregate population 7,677). *Downton* sub-district, in addition to the nine parishes formerly constituting the sub-district (aggregate population 4,713), also comprises the three parishes of Earldoms, Landford, and Whiteparish (aggregate population 1,400), which were formerly comprised in *Alderbury* sub-district; and *Salisbury* sub-district, in addition to the three parishes formerly constituting the sub-district (aggregate population 8,884), also comprises the three parishes of Britford, West Harnham, and The Close (aggregate population 1,896), which were formerly comprised in *Britford* sub-district.
261	WIMBORNE	1 August	The sub-districts of *Witchampton* and *Wimborne* were united under the name of *Wimborne* (aggregate population 10,251).

TABLE **57.**—ENGLAND. **Changes** in the **Constitution** of **Registration Districts** and **Sub-districts** during the Year **1888**—*continued.*

No. of District.	NAME OF REGISTRATION DISTRICT.	Date of Change.	Nature of Change.
285	BARNSTAPLE	1888. 1 July	The number of sub-districts forming this district was reduced from six to five, the sub-district of *Braunton* having been dissolved. The five sub-districts are now constituted as follows:—*Barnstaple* sub-district comprises the parish of Barnstaple (population 9,518). *Parracombe* sub-district (aggregate population, 2,710) remains unaltered. *Combmartin* sub-district, in addition to the six parishes which formerly constituted such sub-district, viz., Arlington, Bratton-Fleming, Combmartin, Kentisbury, Loxhore, and Stoke-Rivers (aggregate population 2,829), also comprises the two parishes of Berrynarbor and East Down (aggregate population 1,043) which were formerly comprised in the *Ilfracombe* sub-district. *Ilfracombe* sub-district comprises three parishes which formerly belonged thereto, viz., Bittadon, West Down and Ilfracombe (aggregate population, 6,838), the parish of Goodleigh (population 250), which was formerly in Barnstaple sub-district, and the eight parishes of Ashford, Braunton, Georgeham, Heanton-Punchardon, Marwood, Morthoe, Pilton, and Sherwill (aggregate population 7,103) which were formerly comprised in *Braunton* sub-district. *Bishop's Tawton* sub-district, in addition to the eight parishes formerly constituting the sub-district, viz., Atherington, Bishop's Tawton, Fremington, Horwood, Instow, Newton Tracey, Tawstock, and Westleigh (aggregate population 6,100), also comprises the two parishes of Land Key and Swimbridge (aggregate population 1,815), which were formerly comprised in *Barnstaple* sub-district.
316	AXBRIDGE	1 January	The name of *Banwell* sub-district was altered to *Weston-super-Mare.*
336	TEWKESBURY	1 October	The sub-districts of *Tewkesbury* and *Overbury* were united under the name of *Tewkesbury* (aggregate population 12,994).
548	LANCHESTER	1 April	The sub-district of *Lanchester* was divided into two sub-districts, viz., *Consett* sub-district, comprising the eight parishes of Medomsley, Billingside, Benfieldside, Healeyfield, Conside-cum-Knitsley, Iveston, Ebchester, and Muggleswick (aggregate population 23,219); and *Lanchester* sub-district, comprising the seven parishes of Greencroft, Lanchester, Langley, Esh or Ash, Satley, Cornsay, and Hedleyhope (aggregate population 16,439).
557	TYNEMOUTH	1 October	The parishes of East Hartford, West Hartford, and Cramlington (aggregate population 5,939) were transferred from the sub-district of *Blyth* to the sub-district of *Earsdon.*
589 and 590	BRIDGEND AND NEATH	1 April	The parish of Llangynwyd Higher (population 2,444) was transferred from the *Margam* sub-district of NEATH to the *Maesteg* sub-district of BRIDGEND.
589	BRIDGEND	1 May	The sub-district of *Maesteg* was divided into two sub-districts, viz., *Maesteg* sub-district, comprising the four parishes of Llangynwyd Higher, Llangynwyd Middle, Llangynwyd Lower, and Cwmdû (aggregate population 9,782); and *Ogmore* sub-district, comprisidg the five parishes of Bettws, Llangeinor, Llandyfodog, Ynysawdre, and St. Bride Minor (aggregate population 8,632).

Under the provisions of "The Divided Parishes and Poor Law Amendment Acts, 1876 and 1879," changes were made on the 24th March 1888 in the constitution of the following Districts, viz.:—MALLING (47), MAIDSTONE (50), HOLLINGBOURN (51), EAST ASHFORD (55), ELHAM (65), ROMNEY MARSH (66), ROMSEY, (99), STOCKBRIDGE (100), WINCHESTER (101*), ANDOVER (110*), FARINGDON (114*), WARE (130), HERTFORD (134), BICESTER (151), BANBURY (155*), BRACKLEY (156), AMPTHILL (173), WOBURN (174), ORSETT (190*), BILLERICAY (191), CHELMSFORD (192), MALDON (194), LEXDEN (197), HALSTEAD (198), BRAINTREE (199), DUNMOW (200), SUDBURY (203), BLANDFORD (260), WIMBORNE (261), POOLE (262), TAUNTON (306), BRIDGWATER (307), CLUTTON (316*), SPILSBY (422*), LOUTH (423*), NANTWICH (449*), CHESTER (450*), GREAT OUSEBOURN (488*), KNARESBOROUGH (489*), THIRSK (529*), RICHMOND (541*), HEXHAM (559), BELLINGHAM (561), MORPETH (562), ALNWICK (563), and ANGLESEY (630A*).

*** In these cases the limits of the sub-districts only are affected.**

* The *Registration Counties* consist of groups of Registration Districts, which are generally co-extensive with the Poor Law Unions. A District which extends into two or more Geographical Counties is included entirely in that Registration County in which the principal town of the District, or the greater part of the population, is located. The boundaries of the Registration Counties differ therefore more or less from the boundaries of the Geographical Counties. For areas and populations of the Registration Divisions and Counties, *see* pages 64-67.

* The 632 *Registration Districts* (Paddington 1a and Holyhead 630b having been constituted Registration Districts since the numerical arrangement 1 to 630 was adopted on 1st January 1881) are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births, Deaths, and Marriages, and are nearly always identical with the Poor Law Unions of the same names; they are arranged, according to the local position, under the Registration Counties. The Registration Sub-districts (2130 in number at the end of the year 1888) are sub-divisions of Registration Districts, within which the Births and Deaths are registered by Registrars severally appointed for that purpose. The letter *W* denotes that the Sub-district contains within its limits a Workhouse Establishment belonging to the District or Union; *w* indicates that a Workhouse Establishment receiving inmates from other Districts than the one in which it stands is included; *H* indicates a Hospital or Infirmary; *L* a Lunatic Asylum; and repetitions of these letters show the number of such Institutions in each Registration sub-district.

† The Deaths in the principal Institutions in England in 1888 are given on pages 71-92.

* 148.—On the 1st April 1888, the parishes in the District of Thame were re-arranged and the number of sub-districts reduced from three to two, the sub-district of Brill being abolished. In the above Table the Births and Deaths are shown as if the change had come into operation on the 1st January 1888.

* 336 : 1.—On the 1st October 1888, the sub-districts of Tewkesbury and Overbury were united for registration purposes and called Tewkesbury. In the above Table the Births and Deaths are shown as if the change had come into operation on 1st January 1888.

† 339.—The District of Hereford comprises the two Poor Law Unions of Hereford (Dewchurch, Fownhope, Burghill, and Hereford City sub-districts), and Dore (Madley, Kentchurch, and Clodock sub-districts).

* 589 : 1 and 590 : 1.—On the 1st April 1888 the parish of Llangwynyd Higher (population in 1881, 2444) was transferred from the sub-district of Margam in the District of Neath to the sub-district of Maesteg in the District of Bridgend (*see* Table 57, page lxiv). In the above Table the Births and Deaths registered during the March quarter in this transferred parish are shown in Neath District, and those registered during the last three quarters of the year in Bridgend District.

† 589 : 1.—On the 1st May 1888 the sub-district of Maesteg was divided into the two sub-districts of Maesteg and Ogmore.

DEATHS IN WORKHOUSES, HOSPITALS, AND PUBLIC LUNATIC ASYLUMS.

1888.

The following Table shows the numbers of deaths (Persons, Males, and Females) registered during 1888 in the Workhouses, Hospitals, and Public Lunatic Asylums of England. These figures afford the means of correcting the mortality of districts and sub-districts in which these Institutions are situated. The Table includes 1754 Institutions; of which 740 are Workhouses, Workhouse Infirmaries, or Workhouse Schools; 924 Hospitals or Infirmaries; and 90 Lunatic Asylums. The Lunatic Asylums are mostly County Asylums, but a few private Asylums which receive pauper patients (held on that account to be public for the purposes of this Table) are also included. In these 1754 Institutions 58,092 deaths were registered during the year, or 11·4 per cent. of the total deaths in England and Wales, against 10·8 per cent. in each of the two preceding years; 35,203 occurred in Workhouses, 17,355 in Hospitals, and 5535 in Lunatic Asylums. The proportion to total deaths was 6·9 per cent. in Workhouses, 3·4 in Hospitals, and 1·1 in Lunatic Asylums. The proportion of deaths recorded in Workhouses, which steadily increased from 5·6 per cent. in 1875 to 6·7 in 1885, further rose, after a slight decline in 1886 and 1887, to 6·9 per cent. in 1888.

Information relating to the deaths recorded in many Private Lunatic Asylums, Private Asylums for Idiots and Imbeciles, and in a few other institutions, will be found in the notes to the following pages.

Deaths in Workhouses, Hospitals, and Public Lunatic Asylums, 1888.

---

* In this classification of Violent Deaths the totals of the sub-divisions Burns, Scalds, &c., Drowning, and Suffocation, necessarily differ from the totals of the headings bearing similar names in the classification of Causes of Death on pp. 118, 119, as the classification here takes account of the cause of the injury, and there only of the nature of the injury.

* The deaths of 10 males from Hydrophobia in the year are classed under Zoogenous Diseases in the Table of Causes of Death (*see* p. 110)

† When a person dies from an operation, performed on account of any disease or injury the nature of which is stated in the certificate, the death is classed under that disease or injury.

OF the above 10,546 ACCIDENTS, 81 are stated to have occurred to Persons in a state of INTOXICATION, and 5 to Persons suffering from DELIRIUM TREMENS. And in 278 other cases Death was accelerated by the supervention of ERYSIPELAS, MORTIFICATION, PYÆMIA, or TETANUS.* Here follow the details:—

CAUSES INDUCING OR ACCELERATING DEATHS FROM ACCIDENT.		ALL AGES.	Total under 1 Year. Infants under 1 Month.	Total under 1 Year. Others.	1–	2–	3–	4–	Total under 5 Years.	5–	10–	15–	20–	25–	35–	45–	55–	65–	75–	85 and upwards.

* The deaths of 4 females from Hydrophobia in the year are classed under Zoogenous diseases, in the Table of Causes of Death (*see* p. 111.)

† When a person dies from an operation performed on account of any disease or injury the nature of which is stated in the certificate, the death is classed under that disease or injury.

OF the above 4362 ACCIDENTS, 58 are stated to have occurred to Persons in a state of INTOXICATION, and 2 to Persons suffering from DELIRIUM TREMENS. And in 69 other cases Death was accelerated by the supervention of ERYSIPELAS, MORTIFICATION, PYÆMIA, or TETANUS.* Here follow the details:—

CAUSES INDUCING OR ACCELERATING DEATHS FROM ACCIDENT.		ALL AGES.	Total under 1 Year.		1–	2–	3–	4–	Total under 5 Years.	5–	10–	15–	20–	25–	35–	45–	55–	65–	75–	85 and upwards.
			Infants under 1 Month.	Others.

INDEX OF REGISTRATION DISTRICTS.

The following Index furnishes a reference to the *Number* of each REGISTRATION DISTRICT in the topographical arrangement adopted in the Tables of Abstracts contained in the Report.* The alphabetical arrangement places compound names in the order in which they are pronounced: thus, East Ashford will be found under the letter E, and *not* under A.

In consequence of numerous alterations (amalgamations of districts and formations of new districts) since the numerical arrangement, 1 to 623, was adopted in the Abstracts for the year 1847, the districts were re-numbered consecutively from 1 to 630 in the Abstracts for the year 1881. Since that date two new Registration Districts have been formed, the District of Kensington (1) having been divided into Paddington (1*a*) and Kensington (1*b*), and the District of Anglesey (630) into Anglesey (630*a*) and Holyhead (630*b*).

For names of Towns, such as Leamington, Torquay, &c., which are not found in this "Index of Registration Districts," see the "Index of Registration Sub-districts" (pp. 208-217) *and "Index of certain Towns"* (pp. 218, 219).

INDEX OF REGISTRATION SUB-DISTRICTS.

[This alphabetical arrangement places the Registration Sub-Districts (or Registrars' Districts) having *compound names* in the order indicated by the usual pronunciation of those names; thus, East Grinstead will be found under the letter E, and not under G; St. James under the letter S, and not as "James, St." The number against each Sub-District, in the third column, refers to its numerical place in the Tables of Abstracts; thus, Abbey Holme (573; 2) is the 2d Sub-District of the Wigton District, No. 573.]

SUB-DISTRICT.	DISTRICT.	NO.
A		
Abbey Holme	Wigton	573; 2
Abbots Bromley	Uttoxeter	366; 2
Abbotsbury	Weymouth	264; 4
Abbots Langley	Watford	137; 4
Aberdare	Merthyr Tydfil	588; 4

REPORT

TO

The Right Honourable CHARLES T. RITCHIE, M.P., President of the Local Government Board, &c. &c.

(1889.)

SIR,

I HAVE the honour to submit to you the following report on the births, marriages, and deaths registered in England and Wales in the year 1889.

POPULATION.

The population of England and Wales, as enumerated in April 1881, consisted of 25,974,439 persons. The natural increase, or the excess of births over deaths from that date to the middle of 1889 amounted to 3,067,314; so that the population at the later date, could its growth be determined simply by the balance between births and deaths, would have been 29,041,753. Emigration and immigration cannot, however, be disregarded in an estimate of the population; and, in the absence of sufficiently full information on these points, the estimated populations published in the Annual Reports are based on the assumption that the rate of increase which prevailed in the last intercensal period has since been maintained, a method which, it has been shown (see pp. v–vi of 50th Annual Report), is not likely to lead to serious error when so large an area as the entire country is dealt with.

The population, thus estimated, in the middle of the year 1889 was 29,015,613, consisting of 14,119,824 males and 14,895,789 females (Table 1). It is on this estimated population that the rates in this report have been calculated.

MARRIAGES.

The number of marriages registered in the year 1889 was 213,865, corresponding to a rate of 14·7 persons married per 1000 living. This is a higher rate than that in any year since 1884, when it was 15·0, declining to 14·4 in the following year, and to 14·1, the lowest on record, in 1886; while both in 1887 and 1888 the rate was 14·2. An examination of the rates in counties shows that the rise was general, excepting that in Berkshire, Dorsetshire, and Leicestershire the rate in 1889, as compared with that in the preceding year, was stationary, and that in Hertfordshire, Huntingdonshire, Norfolk, and Rutlandshire there was a slight decline. The rise was equal to 9·7 per cent. in Buckinghamshire, 11·2 in Derby, 13·0 in Herefordshire, 13·8 in Northumberland, 14·7 in Westmorland, 16·7 in Bedfordshire, and 17·7 in Monmouthshire. In London the improvement was very slight.

Continuing the comparison, which has been drawn in former reports, of the marriage-rate with the value of British exports and with the price of wheat, it is noteworthy that, though the marriage-rate and the mean value of exports per head of population rose together, as is the general rule, the average price of wheat fell and was 6·5 per cent. under the low average price of the preceding year.

TABLE A.—MARRIAGE-RATE, BRITISH EXPORTS and IMPORTS, PRICE of WHEAT, and amount cleared at the London Bankers' Clearing House, 1860–89.*

YEARS.	Marriage-rate.	Value per Head of Population of United Kingdom.			Average Price of Wheat per Quarter.	Amount cleared at the Bankers' Clearing House per Head of Population.

1889	14·7	6 11 2	11 6 1	19 12 6	29 9	263

* The figures in the marriage-rate column are not strictly comparable with those in the value columns, inasmuch as the former relate only to England and Wales, while the latter relate to the whole of the United Kingdom. The figures relating to exports and imports and to the price of wheat are derived from the Board of Trade Statistical Abstracts; and those showing the amount cleared at the London Bankers' Clearing House are calculated upon the population of England and Wales, and are derived from the same source.

Forms of Marriage.—Of the 213,865 marriages contracted in the year, 149,356, or 698 per 1000, were celebrated according to the rites of the Established Church, and 64,509, or 302 per 1000, otherwise. These proportions show a further development of the tendency, alluded to in former reports, for church marriages to decline, the proportion of such marriages in 1889 being the lowest yet recorded. The increase in the proportion of other marriages was principally, as usual, under the head of civil marriages in Superintendent Registrars' offices. The proportions of Roman Catholic marriages and those of other Christian denominations were the same in 1889 as in the preceding year, while there was again an increase in the proportion of marriages by Jewish rites (Table 5).

The proportion of marriages that are celebrated after publication of banns has remained very constant for some years, having fluctuated only between 628 and 632 per 1000 marriages of all kinds in the course of eight years. But when these marriages after banns are compared merely with the total of Church marriages, there is a manifest tendency to increase, this increase taking place at the expense of marriages by licence and marriages by Superintendent Registrar's certificate. The proportion rose steadily year by year from 870 per 1000 in 1880 to 906 per 1000 in 1889.

First marriages; Re-marriages.—The marriages of bachelors, spinsters, widowers, and widows in 1889 all show an increase as compared with the marriages of persons of these several conditions in the previous year; but while the proportionate numerical increase of bachelors who married was 5·4 per cent., and that of spinsters 5·2 per cent.; the proportionate numerical increase of widowers who married was but 1·4 per cent., and that of widows 2·4 per cent. It will be seen in Table 7 that, of 1000 men who married in 1889, 885 were bachelors, and 115 were widowers; and, of 1000 women who married, 919 were spinsters and 81 widows. The proportions of widowers and widows show a still further decline.

Re-marriages of Divorced Persons.—The number of persons married in 1889 who were described in the register as having been previously divorced was 150, including 75 men and 75 women; the number of such persons married was smaller than in recent years, for in the preceding four years the numbers were 170, 163, 173, and 178 respectively. Of the 75 divorced men, 59 married spinsters, 14 married widows, and 2 married divorced women. Of the 75 divorced women, 62 married bachelors, 11 married widowers, and 2 married divorced men.

Ages at Marriage.—In 8,062, or 3·8 per cent., of the marriages, the ages of both contracting parties were not inserted in the register. In 1888 the proportion was 5·0 per cent., to which it had gradually fallen, as was stated in the last Report, from such high proportions as 40·6 in 1858 and 21·1 in 1878. The mean age of the 205,803 couples, whose ages were stated, was 28·23 years for men, and 25·95 years for women. As was pointed out in the Forty-eighth Report (pp. viii, ix) there has been since 1873, concurrently with a falling marriage-rate, a steady rise in the mean ages at marriage. In 1889, however, though there was an appreciable rise in the marriage-rate, this increase in the mean ages at marriage was arrested, for in the preceding year the mean age had been 28·29 years for men, and 25·97 years for women. There was a further decline in 1889 in the marriages of males under age, the proportion in 1,000 marriages being 61, while the proportion of females under age was 199, or the same as it was in 1888.

Signature in Marriage Register.—The men who in 1889 signed the marriage register with marks instead of writing their names were in the proportion of 78 in 1000, and the women in that of 90 in 1000; while in 27 out of 1000 marriages both husband and wife used that form of signature. With the progress of elementary education there has been a constant diminution in the proportion of both men and women signing with marks; and in 1889 the proportion, as compared with that for 1888, showed a reduction of 6·0 per cent. for men and of 7·2 per cent. for women.

Buildings registered for the Solemnisation of Marriages.—At the end of 1889 there were 14,966 Churches or Chapels belonging to the Established Church in which marriages could be solemnised, showing an increase of 43 upon the number at the end of the preceding year. There were also 10,335 buildings registered for marriage by other rites than those of the Established Church (Table 9), showing an increase of 219, or 2·2 per cent. upon the number on the register at the end of 1888.

Certified Places of Worship.—During the year 1889, 633 new buildings were certified for religious worship under the provisions of the Acts 15 & 16 Vict. c. 36, and 18 & 19 Vict. c. 81, while 151 buildings already certified were removed from the register by cancellation; the number of buildings so certified on the register at the end of the year was 26,433. It is probable, however, that some of these are no longer used, though no steps have been taken to remove them from the register by cancellation.

BIRTHS.

The births registered in the year numbered 885,944, and were in the proportion of 30·5 to 1000 persons living. This is the lowest birth-rate recorded in any of the last 50 years, and a further step in the decline which has gone on continuously since 1876, when the birth-rate was 36·3, and at its maximum. (Table 2.)

The estimates of the living population in single counties, in a year so far removed from the last enumeration, are of course doubtful; but, accepting such estimates as correct, the rate varied from 24·7 in Rutlandshire, 24·8 in North Wales, 25·0 in Sussex, 26·1 in Herefordshire, and 26·9 in Surrey (extra-met.), to 33·2 in South Wales, 33·8 in Staffordshire, 33·9 in Durham, 35·0 in Essex, and 36·8 in Monmouthshire, most of the latter being mining counties, in which the birth-rate is almost invariably high. (Table 10.)

Sex.—The male births numbered 451,218, and the female births 434,726, the former being to the latter in the proportion of 1038 to 1000, which was also the proportion in the preceding decennium 1879–88.

Illegitimate Births.—The infants registered as born out of wedlock numbered 40,627, being in the proportion of 1·4 to 1000 of the population, and 46 to 1000 registered births; these proportions being the same as in the immediately preceding year, 1888, but otherwise the lowest on record. (Table 2). The registration counties in which the proportion of illegitimate to total births was highest were, as usual, Norfolk, Herefordshire, Shropshire, Cumberland, Westmorland, and North Wales. (Table 10.)

DEATHS.

The deaths registered in the year numbered 518,353, and were in the proportion of 17·9 to 1000 of the estimated population. In the next preceding year the proportion had been 17·8, and these two rates are by far the lowest as yet recorded, the next lowest having, moreover, been that of the immediately preceding year 1887, when the rate was 18·8. In each of the nine years of the current decennium the recorded rate has been under 20·0, whereas in no previous year had it ever fallen so low as that point. (Table 2.)

County death-rates.—It has been mentioned already that the estimates of the population of separate counties are not very trustworthy; accepting them, however, as accurate, the death-rate in every county in 1889 was below the previous decennial average, with the exceptions of Northumberland, and Westmorland; but varied from 13·7 in Sussex, 14·0 in Surrey (extra-met.), 14·3 in Berkshire, and 14·8 in Rutlandshire and Huntingdonshire, to 19·1 in Durham, 19·3 in South Wales, 19·4 in the West Riding, 20·3 in Monmouthshire, 20·9 in Northumberland, and 21·0 in Lancashire, the geographical distribution of low and high rates being much the same as in the previous decennium. (Table 10.)

Sex.—The 518,353 registered deaths included 266,102 of males and 252,251 of females. The death-rate of males was 18·8, and that of females 16·9 per 1000 living of the corresponding sex, showing declines respectively of 8·3 and of 7·7 per cent. from the average rates in the preceding ten years.

Out of equal numbers living there were 1113 deaths of males to 1000 deaths of females, a difference somewhat below that of the previous decennial average, which gave 1119 male to 1000 female deaths.

Ages at Death.—In Tables 11–13 are given the death-rates at different ages for each sex; and it will be there seen that at every age-period from 5 to 45 years the rate both for males and for females was the lowest on record in the past half-century, though this was not the case for the remaining age-periods, namely, among children under five and persons over 45 years of age; yet even at these ages the rates were considerably below the averages of recent years. As has been pointed out in previous reports, the diminution of mortality, attributable to sanitary measures, has been much more marked in the earlier stages of life than among older persons.

The proportion of deaths of infants in the first year of life to registered births, or the infantile mortality, was 144 to 1000, and slightly above the previous decennial average which had been 141 to 1000.

Of the total 127,198 deaths of infants, 61,202 were in the first three months, 26,024 in the second three months, and the remaining 39,972 in the last six months of the first year of life. These figures, taken in connection with the registered births, give annual death-rates of 286 per thousand living under three months of age, 128 per thousand under six but over three months, and of 103 per thousand for infants between six months and a year. These rates are slightly higher than those obtained from the births and deaths in the total nine years of the current decennium 1881–89), which show respectively 282, 123, and 101 per thousand living at each age.

The infantile mortality varies enormously in different counties; being, as might be anticipated, highest in those in which the population is in large proportion urban and industrial. Of these, Lancashire and Leicestershire may be taken as examples, these being the two counties in which the infantile death-rate was highest both in 1889 and in the decennial period 1879–88; and with these may be contrasted the mainly rural counties in the South-Eastern and the South-Western Divisions (Table 10). The annual mortality in 1889 in these several areas for infants in the several subdivisions of the first year of life was as shown in the following Table:—

TABLE B.—ANNUAL DEATHS per thousand living at each Age, 1889.

Area.	0–3 Months.	3–6 Months.	6–12 Months.
England and Wales - -	286	128	103
Leicestershire - -	338	180	118
Lancashire - - -	321	162	140
South-Eastern Division -	227	89	68
South-Western Division -	233	90	76

From these figures it would appear that while the conditions of life in the manufacturing counties are highly unfavourable to infants at all periods in their first year, the destructive influences are much more intensely active after the first three months are past than in that earlier period; for while the rates in the two manufacturing counties, as shown in the table, are only about 50 per cent. higher than the rates in the two rural divisions for infants under three months of age, they are from 80 to 100 per cent. higher for infants between three and six months. It may, however, not impossibly be that the smaller difference in the rates of the first three months is in part due to the practice of dealing with infants who have been born alive, but have died almost immediately after birth, as though they had been still-born, being more common in towns than in rural districts.

Among the deaths were 76 of reputed centenarians, 21 being men and 55 being women.

Urban and Rural mortality.—It has been shown that the death-rate for England and Wales rose slightly in 1889 above the rate of the preceding year. This rise was entirely brought about by an increased mortality in the Urban Districts, in which the rate rose from 18·4 to 18·6, while in the Rural Districts there was a slight decline, the rate falling from 16·7 to 16·5 (Table 24). Out of equal numbers living there were 113 deaths in the urban population to 100 in the rural population.

REGISTERED CAUSES OF DEATH.

The assigned causes of death were distributed as follows in the several classes :—

TABLE C.—MORTALITY FROM THE SEVERAL CLASSES OF DISEASES.

Causes of Death.	Total Deaths 1889.	Rate per Million living.									
		1889.	1888.	1887.	1886.	1885.	1884.	1883.	1882.	1881.	Mean 1871–80.
Zymotic diseases - -	69,776	2,405	2,097	2,660	2,648	2,507	3,094	2,639	3,088	2,660	3,724
Parasitic diseases - -	707	25	25	29	35	30	38	39	37	39	57
Dietetic diseases - -	1,898	66	62	63	59	59	58	66	68	66	63
Constitutional diseases -	91,667	3,158	3,111	3,166	3,330	3,276	3,404	3,407	3,395	3,328	3,594
Developmental diseases -	44,099	1,520	1,543	1,555	1,618	1,598	1,574	1,632	1,558	1,582	1,674
Local diseases - -	267,243	9,212	9,479	9,720	9,915	9,908	9,543	9,890	9,591	9,348	9,920
Violence - - -	17,497	603	611	642	626	625	651	675	669	697	736
Ill-defined and not specified causes - -	25,466	876	871	955	1,047	1,007	1,149	1,188	1,154	1,160	1,610
All causes - -	518,353	17,865	17,799	18,790	19,278	19,010	19,511	19,536	19,560	18,880	21,378

Zymotic or Specific Febrile Diseases.—The deaths ascribed to this class of specially preventable diseases numbered 69,776, and were in the proportion of 2405 to a million persons living. This rate, though considerably above the excessively low rate of the immediately preceding year, was lower than that of any other year in the current decennium, and no less than 35 per cent. below the mean of the 10 years 1871–80. The excess in 1889, as compared with the immediately preceding year, was due to the greater mortality under two headings, namely, measles and diarrhœa, the latter of which had been in 1888 at its minimum and the former exceptionally low.

The deaths from *small-pox* amounted to the unprecedentedly low number of 23, and were less than one-tenth of the smallest number recorded in any previous year. There were, however, 83 deaths ascribed to chicken-pox, and it is very probable that most of these were in reality cases of modified small-pox, true chicken-pox being an ailment that is rarely, if ever, fatal.

The deaths from *measles* numbered 14,732, and were in the proportion of 508 to a million living. This rate, though lower than that of 1885 or 1887, was higher than that recorded in any other year since 1874. It is noteworthy that while the mortality from most diseases has in late years shown a large decrease, the mortality from measles has on the other hand in three of the past five years, viz. :—1885, 1887, 1889, been in great excess. It was in London and in the counties of the Northern, the York, and the

North-western Divisions that the mortality under this heading was highest, namely, in Cheshire, Lancashire, the West and East Ridings, Durham, and Cumberland (Table 23); but the rate was also in excess in Oxfordshire, Herefordshire, and Staffordshire.

The deaths from *scarlet-fever* numbered 6698, and were in the proportion of 231 to a million living, the remarkable falling off in recent years in the mortality from this disease having thus been fully maintained. In no one of the last five years, 1885–89, did the scarlet-fever rate reach 300 per million, the average for the quinquennium being only 235, whereas in no previous year since 1855, when the mortality from this disease was first separately calculated, had the rate ever fallen so low as 400 per million, save in 1884, when it just reached that point. (Table 18.) Speaking generally, the highest rates under this heading were, as usual, in the counties of the North Midland, North Western, York, and Northern Divisions, and in South Wales (Table 23); but the mortality was also high in some of the more southern counties, and notably in Devonshire, where it reached 633 per million, mainly owing to a serious outbreak in Plymouth, in which borough the rate was no less than 3399 per million.

The deaths ascribed to *typhus* were only 137, and absolutely, as well as relatively to the population, fewer than in any preceding year in our records. The same was true of the deaths from *simple and ill-defined forms of fever*, which numbered 413.

The deaths ascribed to *diphtheria* numbered 5368, or 185 to a million living. The rate was also 185 in 1884, but with this exception there is no year since 1865 with so high a recorded mortality from this disease. (Table 18.) It was, as usual, in the South Eastern parts of England that this disease was most fatal; for of the eight registration counties in which the rate was above the average for the whole country, no less than six were in what has been designated in previous reports as the South Eastern diphtheritic region, these six being London, Kent (extra-metropolitan), Middlesex (extra-metropolitan), Essex, Sussex, and Berkshire, while of the counties in the Western diphtheritic region the only one with excessive mortality was, as had also been the case in 1888, Monmouthshire; the remaining and eighth county with a high rate being, again as in 1888, Lancashire. In considering the increase in the registered mortality from diphtheria, the remarks made in the last Annual Report (p. xxiv.) as to the vagueness with which this term is used, and the probable interchange between the headings Diphtheria and Croup, must not be forgotten. For while the deaths ascribed to diphtheria have increased, those ascribed to croup have diminished, though not in equal degree.

To *whooping-cough* were attributed 12,225 deaths, or 421 per million living, which was considerably below the average rate in the preceding decennium, which had been 461 (Table 23). This doubtlessly stands in connection with the decline in the mortality from diseases of the respiratory system, which, as will be presently seen, was almost at the lowest point yet recorded.

On the other hand the deaths from *enteric fever*, 5011 in number, or 173 to a million living, were, relatively to the population, somewhat more numerous than they had been in 1888, and equal to what they had been in 1885. Disregarding, however, these casual fluctuations, the fact remains that the rates in the past five years, 1885–89, were the five lowest rates in our records, and that the average in that quinquennium was only 176, though the lowest rate recorded in any one previous year had been 212 per million.

Taking the three headings under which continued fevers are tabulated together, the aggregate rate was below 100 per million in Berkshire, Hertfordshire, Wiltshire, Herefordshire, Rutlandshire, and Westmorland, all of which are rural counties, while it varied from 203 up to 308 per million in

Huntingdonshire, Norfolk, Dorsetshire, Leicestershhire, Nottinghamshire, Cheshire, Lancashire, West and East Ridings, Durham, Northumberland, and South Wales, most of which contain a large proportion of mining or manufacturing population.

The deaths from *diarrhœa,* including *dysentery*, numbered 18,434, and were in the proportion of 635 to a million living. This rate was very considerably above that of the immediately preceding year, which was the lowest recorded for forty years, but was below the average of the preceding decennium, which had been 694. The mortality did not exceed 282 per million in Surrey (extra-metropolitan), Huntingdonshire, Wiltshire, Dorsetshire, Herefordshire, Rutlandshire, Westmorland, and North Wales, while it varied from 909 to 1025 per million in Warwickshire, Leicestershire, Lancashire, East Riding, and Durham (Table 20).

Puerperal Fever.—The deaths attributed to this cause were 1852, and, adding to these 1733 deaths from the other accidents of childbirth, we have a total of 3585 deaths directly ascribed to parturition. This was in the proportion of 4·05 deaths to 1000 registered births, a rate considerably below the previous decennial average, which had been 4·62. (Table 23.)

The mortality from *puerperal fever* stands in close relation with the mortality from *erysipelas*, the two showing a great tendency to rise or fall together, as will be seen if the figures for a succession of years, as given in Table 15, be carefully examined. In 1889 the deaths ascribed to puerperal fever were fewer than in any earlier year of the current decennium, and the same was the case with the deaths from erysipelas, which only amounted to 1209, whereas the average for the preceding eight years 1881–8 had been 2008. The correspondence in rise and fall between the mortality from puerperal fever and the mortality from erysipelas is closer when the deaths from this latter in the first three months of life are alone taken than when the mortality at all ages is the basis of comparison, from which it may be inferred with much probability that the same poisonous agency which affects young infants and produces erysipelas, possibly by way of the unhealed umbilical cord, also affects the recently delivered mother and results in puerperal fever.

Hydrophobia.—The deaths from this disease numbered 30, and exceeded the registered number in any one of the five next preceding years, with the exception of 1885, when no less than 60 deaths were thus caused. (Table 15.) It was pointed out in the last Annual Report that the returns for the twenty years 1869–88 lead to the conclusion that there are in this country two centres of hydrophobia in man and of rabies in animals, one of which is Lancashire, with radiation into Cheshire and the West Riding, while the other is London, with radiation into the surrounding belt of counties (Fifty-first Annual Report, pp. xiii–xv). The distribution of the deaths in 1889 harmonises with that conclusion, for of the total 30 no less than 15 were registered in Lancashire, West Riding, and Cheshire, while 7 were registered in London itself, and 5 more in the counties into which the disease was described as radiating from the metropolis, namely, 1 in Middlesex (extra-metropolitan), and 2 each in Berkshire and Hampshire. Thus 27 out of the 30 deaths occurred in one or other of the two usual areas, leaving only 3 in the rest of England, namely 1 each in Northamptonshire, Shropshire, and Worcestershire.

Parasitic Diseases.—The great bulk of the deaths in this class are deaths of infants ascribed to "thrush." Gradually the use of this inadequate term as a cause of death has diminished, and consequently there has been a decline in the registered mortality from these diseases. The mortality in 1889 was the same as it had been in 1888, and these two years are those in which it was at its lowest.

Dietetic Diseases.—The main heading in this class is intemperance. To this cause 1566 deaths, 998 being of men and 568 of women, were attributed; a number higher both actually and relatively to the population than in any previous year in our records. (Tables 15 and 16.) Possibly this fact stands in connection with the great and unexpected increase that was shown by the Chancellor of the Exchequer to have occurred in the consumption of spirits in 1889. In addition to the deaths directly ascribed to intemperance, there were 190 others among the deaths from accident in which it was stated that the deceased was drunk when the accident occurred (pp. 196, 199).

Constitutional Diseases.—The deaths in this class numbered 91,667, being in the proportion of 3158 to a million persons living; a rate scarcely different from those of the two next preceding years, but considerably lower than the previous average.

There was a considerable falling off in the mortality from *rheumatic fever*, which was at the lowest point yet reached; and though the mortality from *phthisis* was not lower in proportion to the population than it had been in the immediately preceding year 1888, it was with this exception at its minimum. The mortality from *diabetes* has long been increasing year by year, but in 1889 there was a slight decline, the rate falling from 62 per million in the two years 1887 and 1888 to 60. It was still, however, higher than in any earlier year with these two exceptions.

The deaths ascribed to cancer, using that term as a general designation for all malignant new growths, were 18,654 and in the proportion of 643 to a million persons living; showing a further increase upon the ever growing rates previously recorded. (Table 16.) Some of this increase is most certainly attributable to increased accuracy in statement of cause, and to the system introduced some years back into this office of writing for further information in cases where some vague cause, such as "tumour," has been given as the cause of death in the original certificate; a system which added, for instance, in the year 1889 no less than 421 deaths to the heading Cancer. Nevertheless, in face of the constant and great growth of mortality under this heading, and the expressed belief of medical practitioners specially engaged in dealing with this class of diseases that they are really becoming more and more common, it seems scarcely possible to maintain the optimistic view that the whole of the apparent increase can be thus explained; and it must be admitted, as at any rate highly probable, that a real increase is taking place in the frequency of these malignant affections.

To what causes such increase may be due is a question outside a purely statistical report; but it may be pointed out that if it be true, as appears to be the general though not the universal opinion of medical experts, that the development of new growths is often due to a constitutional and inheritable tendency, and if, as undoubtedly is the case, such development does not as a rule manifest itself till after the usual age of marriage and of parturition, it must follow as a necessary arithmetical consequence that the tendency shall spread wider and wider among the population. In the case of a disease such as tubercular phthisis, which in a large proportion of cases manifests itself before the age of marriage, there will be at any rate to a certain extent a constant, if an insufficient, weeding out from the candidates for matrimony of those who are most seriously liable to this disease; but in the case of cancer there will be no such preservative influence, and so long as persons with this inherited tendency marry practically without let or hindrance of any kind, there must, as already said, be a constantly growing proportion of the population that shares in the constitutional defect.

Whether it be really the case that the tendency to neoplastic growths is inheritable is a question on which it is not intended here to enter, our death-registers not furnishing the requisite data for its examination; but it may be pointed out that neither a very considerable proportion of cases with a family history of similar disease, nor even a considerable proportion of cases with a history of such affliction among the direct progenitors, is of itself sufficient evidence of inheritance. For seeing that one out of 21 males, and one out of 12 women, who reach the age of 35, die eventually of cancerous disease, it follows by the law of probabilities that on an average in one of three cases either a parent or a grand-parent will have died of such an affection, supposing such parents and grand-parents to have died after 35 years of age; and the proportion will be still higher if the circle of relatives be extended so as to include not only these direct progenitors but collateral relatives such as uncles and aunts. For supposing a person to have had besides his six parents and grand-parents only four such collateral relatives, say two uncles and two aunts, it will be an even chance that one or more of these ten persons, half of each sex, will have died of malignant new growth, supposing as before that they have died after their 35th year.*

It is true that the rates from which these arithmetical conclusions are drawn are the rates for the three years 1886–7–8, and that as the proportion of deaths from cancer to deaths from all causes has been constantly increasing, the chances of succumbing to it were not quite so great for our parents and grand-parents as for the present generation; and some deduction would in strictness have to be made on this account. Still it is manifest that, after all due allowance for this, the proportion of cases with a family history of cancer would have to be very high indeed before such proportion could be properly quoted as evidence of inheritance.

In view of the apparent, and probably in part real, increase of malignant new growths, it is desirable to ascertain what light can be thrown by our death registers upon the question whether such increase has been shared equally by both sexes, and by all ages, and all parts of the body.

As regards sex, it has been noted in previous reports (*see* 47th Report, p. xviii.) that the increase has been much greater among males than among females. Thus, in 1851–60, the annual registered mortality from cancer was 195 per million living for males and 434 per million for females; but in 1871–80 the rates had risen respectively to 315 and 622 per million, a rise of 62 per cent. in the male rate, but of only 43 per cent. in the female rate.

As regards age, the following figures for the same two decennia show that the increase has been by no means equally distributed over all the

---

* On the basis of the figures for 1887–8–9, the chance that a man who reaches the age 35 will eventually die of cancer is 1 in 21, and the chance that a woman who reaches the same age will eventually die of cancer is 1 in 12. Taking these proportions, excluding all persons who die before the end of their 35th year, and assuming no heredity, the following table shows how often no death, or one, two, three, &c. deaths from cancer may be expected to occur in 100 families, half the members of which are men and half women:—

Number of Cancer Deaths in Family.	Per 100 Families.		
	Of Six Members, viz.:— 3 Men, 3 Women.	Of Eight Members, viz.:— 4 Men, 4 Women.	Of Ten Members, viz.:— 5 Men, 5 Women.
None	67	58	51
One	28	33	36
Two	5	8	11
Three or more		1	2
	100	100	100

periods of life, but has been greater and greater, with much regularity, the more advanced the age. Thus, among children under 15, the rates show a decline; from 15 to 25 they remain stationary; and then increase progressively with each successive advance of age.

TABLE D.—MEAN ANNUAL MORTALITY from CANCER per MILLION PERSONS LIVING at successive AGE-PERIODS in 1851–60 and in 1871–80.

It remains to consider whether the increased mortality from malignant growths has been shared by all parts of the body. Unfortunately the statements of cause in the death certificates given by medical men are, in a large proportion of cases, inadequate to furnish a secure foundation for trustworthy statistical conclusions; and it is probable that the records of hospitals specially concerned with malignant growths, if scantier in amount than our official death-registers, would make up for such quantitative inferiority by their better quality, and would furnish a more satisfactory basis for scientific inquiry. In a large proportion of deaths ascribed to malignant disease, the part of the body which was the seat of the new growth is not stated in the certificate; often, when it is stated, it is stated in such general terms as to be useless for pathological classification, and rarely, if ever, is the information given whether the organ was the primary seat of the disease, or only secondarily affected. Under these circumstances it would be a waste of labour and of money to abstract year by year, as has been proposed, the deaths from these diseases by the parts of the body in which they were located; and the most that can be done, with reasonable consideration of cost, is from time to time to take out a sufficiently large sample of those cases in which the seat of disease is more or less clearly specified; and, assuming that such samples fairly represent the bulk, to divide out the total cancer mortality in proportions derived from them. That is the method by which the figures in the following table (Table E.) have been obtained. The sample extracted from the registers of 1868 consisted of 3164 deaths, 1018 being of males and 2146 being of females; while the sample for 1888 consisted of 7931 deaths, namely 2854 of males and 5077 of females. The parts stated to have been affected have been grouped so far as the imperfect description allowed, in some cases the most probable place of classification being adopted; but in many cases even probability fails as a guide, and such parts have not been classified at all. (*See page* xvi.)

The figures show in the first place, that, though cancers or new growths are vastly more common among women than among men, yet this excess is entirely due to the great liability of the female generative organs and breast to be thus affected, and that when these organs, and those which are especially likely to be secondarily affected from them, or, in the absence of a post-mortem examination, to be confounded with them, are excluded, the excess is invariably on the side of the male sex.

The organs other than generative or mammary in which the female rate exceeds the male are the axilla and the ribs and sternum, probably secondarily affected from the breast; the liver and peritoneum, probably secondarily affected from the uterus or ovaries; the intestines (not rectum) and the parts vaguely described as abdominal, probably either secondarily

* A dash in these four columns means that no death was registered; a cypher that deaths occurred, but less than one in 1,000.

affected from the generative organs or confounded with them; after which are left, even in this minutely divided list, only such trivial exceptions as the brain, the pancreas, the groin, the spleen, the heart, the thyroid, showing each in very small, and therefore not very trustworthy, figures, an excess on the female side. It is, however, noteworthy that small as the figures are, under most of these exceptional headings the female rate was in excess both in 1868 and 1888. Such was the case with the thyroid, the brain, the groin, and the heart. Disregarding such exceptions, under all the other headings the male exceeds the female mortality; but the parts in which such excess is most notable are the lip, the mouth, and the tongue; for, putting these three together, the male mortality in 1888 was 134, while the female mortality was only 20, per million living over 35 years of age, the male rate being thus nearly seven times greater than the female. The rates, it should be observed, have been calculated only for persons 35 years of age or upwards, the object being to equalise in some degree the age-distribution of the two sexes, and so give greater trustworthiness to comparison of their respective mortalities.

As regards the parts of the body which have suffered from the increase in the registered amount of malignant disease, it would appear from the figures in the table that, with exceptions so trivial that they may be disregarded, the increase has been shared by all parts, though by no means in equal proportions. When the rate of mortality from disease in any specified organ is very small, no great importance can of course be attached to the amount of its apparent increase or decrease, for the addition of one or two cases to the total deaths might double the calculated mortality. We must, therefore, in considering the individual organs, limit ourselves to those in which malignant new growths are of tolerably frequent occurrence, let us say those which gave a mortality in 1868 of not less than 15 per million. There were 12 such for males, and under every one of these, with the single exception of the face, there was a notable increase, varying from 20 to 200 per cent. Among women there were 11 organs that gave severally in 1868 mortalities of more than 15 per million; of these, eight showed more or less increase in 1888, while in three there was a decrease.

The following are the exact increases or decreases per cent. for each of these organs, in each sex, the figures being put in brackets when the rates did not reach 15 per million in 1868 in one or the other sex:—

Parts affected.	Men.	Women.
Arms, Legs, Hands, Feet - - - -	+ 73	− 13
Mouth - - - - - -	+ 55	(− 26)
Tongue - - - - - -	+ 67	− 29
Pharynx, Fauces, Tonsils, Throat - - -	+ 44	− 9
Stomach, Pylorus - - - - -	+ 22	+ 44
Intestines - - - - - - - -	+ 198	+ 273
Rectum - - - - - - - -	+ 102	+ 87
Liver, Gall Bladder - - - - -	+ 124	+ 187
Bladder, Urethra - - - - -	+ 171	(+ 98)
Penis, Testes, Scrotum - - - - -	+ 52	—
Breast - - - - - - - -	(+ 94)	+ 9
Uterus, Ovary, &c. - - - - -	—	+ 19
Lip - - - - - - - - -	+ 58	(+ 204)
Face - - - - - - - - -	− 6	+ 10
Abdomen (not more closely specified) - -	+ 236	+ 142

It thus appears that the increase has been comparatively slight in those organs which are the commonest seats of malignant growths, namely, the generative and mammary organs of women, and has been largest, and this for both sexes, in the organs of the digestive and the urinary systems, and notably in the intestines, rectum, liver, and urinary bladder. Among men there has also been a large increase in disease of what may be called the upper organs of the digestive system, namely, the mouth, the tongue, the pharynx and the fauces, while among women there has been no such increase, but on the contrary a falling off.

Developmental Diseases.—The deaths attributed to *old age* have for some years been declining in number, doubtlessly in consequence of the more precise designation of the causes of death of old persons; this decline continued in 1889, and the registered mortality under this heading was at its minimum. On the other hand, the deaths ascribed to *premature birth*, which, as has been several times pointed out in previous reports, have been for a long series of years becoming more and more numerous in proportion to the registered births, showed a further increase in 1889, having risen progressively from 11·19 per 1000 births in 1861–5 to 16·29 in 1889.

Local Diseases.—The 267,243 deaths included in this heterogeneous class were fewer in proportion to the population than in any previous year of the current decennium or than the average in the preceding decennium. The mortality from *diseases both of the nervous system and of the respiratory organs* was lower than in any year since 1872; the mortality from *diseases of the urinary system*, though still high, was slightly below that of any one of the last six years; while the mortality from *diseases of the liver* was at its minimum.

Violence.—The deaths ascribed to some or other form of violence numbered 17,497, and were in the proportion of 603 to a million living. The mortality from *accident*, as also the mortality from *homicide*, was almost identical with that of 1888, but lower than in any earlier year. The death-rate from *suicide* also, which had been abnormally high in each of the three years 1886–7–8, fell considerably in 1889. There were still, however, 2170 persons, namely, 1626 men and 544 women, who were found on inquest to have destroyed themselves. Twelve men were executed during the year, while 172 persons were found to have been murdered. Of these 172 persons, 74 were infants under one year of age, 61 of these being in the first month of life.

Ill-defined and Not-specified Causes.—The deaths for which either no cause was assigned, or in which the cause was too ill-defined for classification, numbered 25,466, or 4·9 per cent. of all the deaths registered; the proportion had been the same in the immediately preceding year, 1888. These unsatisfactorily-described deaths would have been still more numerous had not 3175 letters of inquiry concerning doubtful cases been sent to medical men; the result of which was to add materially to the numbers under some special headings. For instance, 405 deaths were by this process removed from the vague heading Tumour to Cancer or Malignant Disease; 146 to Uterine or Ovarian Disease, and 41 to Syphilis.

Certification of the Causes of Death.—Of the 518,353 deaths registered during the year 1889, the causes of 474,174, or of 91·5 per cent., were certified by registered medical practitioners; and the causes of 29,079, or of 5·6 per cent. were certified by coroners after inquest. The causes of the remaining 15,100 deaths, or of 2·9 per cent., were not certified, this per-centage showing a further step in the decline in the proportion of uncertified deaths which has been manifested in recent years. It must not be supposed that all these 15,100 deaths were of persons unattended in their last illnesses by medical men. For many of them—especially in mining districts—would have been attended by unregistered medical practitioners, acting as assistants to registered practitioners or otherwise; and a further considerable number would be of children who died very shortly after birth, and for the few hours of their life were in the care of registered midwives. The proportions of uncertified deaths in 1889 varied much as in other years in different counties; the lowest proportions per cent. in English counties being 0·7 in Middlesex (extra-metropolitan), 0·9 in Wiltshire, 1·1 in London and in Monmouthshire; while the highest were 4·1 in Kent (extra-metropolitan) and in Derbyshire, 4·3 in Bedfordshire, 4·4 in Westmorland, 4·5 in Durham, 4·7 in Herefordshire, and 5·6 in Huntingdonshire. In Wales the per-centage was 5·9, being 7·2 in North Wales, and 5·4 in South Wales.

Offences against the Registration Act.—The Registrar-General has found himself compelled in the course of the year to sanction the institution of twenty-two prosecutions for offences against the Registration Act. In each case a conviction was obtained, and a fine inflicted. The offences were of several kinds; in some instances medical men had falsely certified that they had been in attendance upon the deceased persons; in others midwives had falsely certified to stillbirth in the case of live-born infants; in others false addresses had been given in order to evade the vaccination officer; while in the remaining cases, illegitimate children had been registered as born in wedlock.

PROGRESS OF REGISTRATION.

The names in the alphabetical indexes of births, deaths, and marriages recorded in the national register of England and Wales were increased in the year 1889 by 1,832,027, this addition raising the aggregate number of names in the indexes, which at the end of 1889 embraced a period of 52½ years, to 79,386,263. The number of searches in 1889 in the various registers was 41,002, exceeding the number in the previous year by 525. The number of certificates issued was 30,491, showing an increase of 438 on the number in 1888. The fees received for searches and for certificates in 1889 and paid into Her Majesty's Exchequer amounted to 5,884*l.* 2*s.* 6*d.*, and exceeded the amount received in the previous year by 76*l.* 2*s.* (Table 26.)

A list of the various public registers and records lodged in the General Register Office, Somerset House, was published in the 34th Annual Report, pp. xxi–xxii and xxv–xxvi.

MORTALITY IN THE ARMY.*

The average strength of the Army, at home and abroad, in 1889, was 210,298, and the deaths were 1961, the rate of mortality thus being 9·3 per 1000, against 9·6 and 9·7 respectively in the preceding two years. The mortality in the army abroad was 13·8 per 1000, the mean rate in the preceding five years having been 15·4; while the rate in the Army at home was only 5·0, and 1·6 per 1000 below the average rate in the preceding five years, such mean rate itself having shown a considerable decline from the mean rates in previous quinquennia. (Table 29.)

---

* Based upon returns furnished by His Royal Highness the Commander-in-Chief.

MORTALITY IN THE NAVY.*

The average force afloat in 1889 was 50,790. The deaths were 271, being in the ratio of 5·33 per 1000 of the strength. Of the 271 deaths, 197 were due to disease, and 74 (including 7 from heat-stroke) to violence; so that the death-rate from disease was 3·87 and from violence 1·46 per 1000.

Of the 74 deaths from violence, 33 resulted from accidental drowning, 38 from other accidental causes, and 3 from suicide.

BIRTHS AND DEATHS OF BRITISH SUBJECTS AT SEA.

Marine Register Book.—In accordance with the Births and Deaths Registration Act of 1874, commanding officers of British ships, whether in Her Majesty's service or not, are required, under a penalty, to transmit returns of all births and deaths occurring on board their ships to the Registrar-General of Shipping and Seamen, who furnishes certified copies of such returns to the Registrars-General of England, Scotland, and Ireland. These certified copies of entries of births and deaths at sea constitute the "Marine Register Book." To this Register were added 189 entries of births and 3154 of deaths during the year 1889. Of these 3154 deaths, 1545 were of persons of English origin, while 255 were of persons of British origin, so far as could be judged from the entries, which are not always very precise.

Among *passengers* on board merchant vessels at sea (Table 32), 128 births and 484 deaths were reported in 1889, these numbers differing but slightly from those recorded in the preceding year.

Mercantile Marine.—The Registrar-General of Shipping and Seamen reports that the number of masters and seamen afloat in registered vessels belonging to the mercantile marine of the United Kingdom, including the islands in the British Seas, during the year 1889 was 230,263, showing an increase of 6590 upon the number in the preceding year. The reported deaths among masters and seamen during 1889 numbered 3018, corresponding to an annual rate of 13·1 per 1000 of the strength; this was 0·8 per 1000 lower than the rate in the previous year, and was also the lowest rate yet recorded.

INTERNATIONAL VITAL STATISTICS.

In Tables 39–56 will be found international vital statistics relating to most of the principal European States, including the United Kingdom. Table 39 affords the means for comparing the marriage, birth, and death rates in each State for a series of years with the average rates during the period 1861–80. It must, however, be remembered that great caution is necessary in making comparisons between the rates in any one country with the rates in another; inasmuch as there are great differences between countries in the age-distribution of their inhabitants; and it is evident that the marriage, the birth, and the death rates depend largely on this age-distribution.

The *marriage-rate* in 1889 rose not only in England, in Scotland, and in Ireland, but also in Germany, Belgium, the Netherlands, and Norway, whilst in Denmark and in Switzerland it remained stationary, and in Austria, France, and in Italy it declined.

---

* Based upon returns furnished by the Director-General of the Medical Department of the Navy.

The *birth-rate* declined not only in the several divisions of the United Kingdom, but in all the other European States from which figures have been received, with the exceptions of Belgium, Italy, and Austria, in the last-named of which it remained stationary.

The *death-rate*, which rose slightly in England and in Scotland, declined in Ireland, but remained stationary in the aggregate of the United Kingdom. The same was the case in the German Empire. In Norway, and in Switzerland, it rose; but declined in Denmark, Austria, the Netherlands, Belgium, France, and Italy.

I have the honour to be,
Sir,
Your faithful Servant,
BRYDGES P. HENNIKER,
Registrar-General.

General Register Office, Somerset House,
29th November 1890.

REMARKS ON THE METEOROLOGY OF THE YEAR 1889.[*]

BY JAMES GLAISHER, ESQ. F.R.S., &c.

The following remarks, both with regard to atmospheric pressure and temperature, are based on the observations made near London, but they may be taken as having a general application.

Atmospheric Pressure.—The readings of the barometer were generally above their averages till the 28th of January, being particularly so from the 2nd to the 4th and from the 22nd to the 28th, when they were a little more than half an inch above their averages, the mean daily excess for these 28 days being 0·28 in.; from January 29th to March 21st it was generally below, being particularly so on March 20th when it was more than an inch below its average, and on several other days was as much as three-quarters of an inch below; the mean daily deficiency for the 56 days ending March 21st being 0·11 in.; from March 22nd to the 31st it was above, the mean daily excess being 0·21 in., from April 1st to June 15th it was generally below, the mean daily deficiency for these 76 days being 0·11 in.; from June 16th to July 6th it was above, the mean daily excess being 0·15 in., from July 7th to August 25th it was generally below, the mean daily deficiency for the 50 days being 0·13 in.; from August 26th to September 18th it was above, the mean daily excess being 0·13 in.; from September 19th to November 5th it was below, being on several days more than half an inch, the mean daily deficiency for the 48 days being 0·17 in.; and from November 6th to December 31st it was generally above, being particularly so from the 17th to the 20th of November, when it was a little more than three-quarters of an inch above, the mean daily excess for the 56 days being 0·56 in.

The highest reading of the barometer at the height of 150 feet above the sea was 30·55 ins. on January 3rd, and the lowest was 28·80 ins. on March 20th; the yearly range was 1·75 ins.

Temperature.—The temperature of the air was below its average till January 8th, being particularly so on the 5th, 6th, and 7th days, when it was 9°·4, 13°·9, and 9°·2 respectively below, the mean daily deficiency for the eight days being 7°·3; from January 9th to February 1st it was generally above, being particularly so on February 1st, when it was 12° above its average; the mean daily excess for the 24 days being 1°·0; from February 2nd to May 2nd it was generally below, being particularly so from the 10th to the 13th, and 26th of February to March 5th, when it was from 9° to 13° below its average, the mean daily deficiency for the 90 days being 2°·8; from May 3rd to July 13th it was generally above, being particularly so from the 22nd to the 25th of May, and on June 14th, the mean daily excess for the 72 days being 1°·9; from July 14th to November 2nd it was generally below, being particularly so on the 21st, 22nd, and 25th of September, the mean daily deficiency for the 111 days being 2°·3; from November 3rd to the 25th it was above, the mean daily excess being 2°·9; and from November 26th to December 31st it was generally below, being particularly so from November 27th to December 8th, and on the 12th and 29th of December, the mean daily deficiency for the 36 days being 4°·2.

The highest temperatures of the air were 87°·0 at Cambridge, 86°·6 at Royal Observatory, and 86°·0 at Osborne, Salisbury, and Blackheath; and the lowest were 12°·2 at Somerleyton, 12°·5 at Cambridge, and 12°·7 at Barnet.

Rainfall.—The fall of rain was below its average in January; above in February; and below its average again in March. The total fall in the three months at Greenwich was 4·36 ins., being 0·62 in. below the average. The falls of rain were above their averages in April, May, and June. The total for the three months at Greenwich was 7·22 ins., being 1·44 in. above the average. The falls of rain were below their averages for July, August, and September. The total fall for the three months at Greenwich was 5·56 ins., being 1·76 in. below the average. The fall of rain was above its average in October; and below in November and December. The total fall for the three months at Greenwich was 6·15 ins., being 0·95 in. below the average. The fall of rain for the year was 23·29 ins., being 1·91 ins. below the average; and the number of days on which it fell was 158.

---

[*] For Meteorological Tables, *see* pp. lviii–lxiii.

The heaviest falls of rain at our stations in the year were at Stonyhurst 42·50 ins., at Truro 37·38 ins., and at Bath 36·62 ins.

The least falls were at Leeds 20·98 ins., at Whitchurch 21·95 ins., and at Bradford 22·59 ins.

The greatest numbers of days of rain were 216 at Guernsey, 211 at Truro, and 205 at Stonyhurst; and the least were 145 at Barnet, 146 at Wolverhampton, and 147 at Blackheath.

Thunderstorms occurred on 68 days at the different stations during the year; of these, 13 were in May, 10 in July, 9 in each of the months of April, August, and October, 7 in June, 6 in September, 3 in November, and 1 in both February and December, and none were reported in January or March.

Thunder was heard but lightning was not seen on 67 days during the year; of these, 14 were in May, 12 in April, 10 in both July and August, 6 in October, 5 in June, 3 in September, 2 in each of the months of February, March, and November, and 1 in January.

Lightning was seen but thunder was not heard on 39 days during the year; of these, 8 were in September, 7 in October, 6 in May, 4 in both February and July, 3 in each of the months of August, November, and December, and 1 in June.

Solar halos were seen on 70 days during the year; of these, 10 were in both March and August, 9 in September, 7 in both October and November, 6 in both May and December, 4 in April, 3 in each of the months of February, June, and July, and 2 in January.

Lunar halos were seen on 35 days during the year; of these, 6 were in both February and March, 5 in both January and December, 3 in each of the months of September, October, and November, 2 in May, and 1 in both April and August.

Aurora Borealis was seen on 1 day during the year, viz., on November 26th at Halifax.

Snow fell on 69 days during the year; of these, 24 were in February, 15 in March, 14 in December, 7 in April, 4 in January, 3 in November, and 2 in October; the last fall in the spring was on April 14th at Royston; none fell in May, June, July, August, or September; and the first fall in the autumn was on the 26th of October at Plymouth.

Hail fell on 83 days during the year; of these, 18 were in February, 12 in April, 10 in March, 8 in both October and December, 7 in May, 6 in November, 4 in July, 3 in each of the months of January, August, and September, and 1 in June.

Fog prevailed on 189 days during the year; of these, 26 were in December, 22 in both January and October, 21 in November, 17 in September, 16 in both May and June, 14 in March, 12 in April, 10 in July, 7 in August, and 6 in February.

PRELIMINARY TABLES.

---

* The populations used are deduced from the rates of increase observed in the 40 years 1841-81 (*see* Table 1), and are distributed in the several groups of ages according to the proportions found to prevail at the last five Censuses.

* Deaths from Relapsing Fever prior to 1869 were classed with "Simple and Ill-defined Fever," and deaths from Cerebro-spinal Fever prior to 1877 were classed with Typhus, but, since those dates, have been included under this heading.

† Deaths of children under 5 years of age from Remittent Fever were classed with Enteric Fever from 1869 to 1880, but in previous and subsequent years have been included under this heading.

TABLE 15 (*continued*).—ENGLAND.—**Deaths** from **Various Causes, 1865–89.**

CAUSE OF DEATH.	1865.	1866.	1867.	1868.	1869.	1870.	1871.	1872.	1873.	1874.	1875.	1876.	1877.	1878.	1879.	1880.	1881.	1882.	1883.	1884.	1885.	1886.	1887.	1888.	1889.

* Deaths from this cause prior to 1881 were classed, partly with "Diseases of Respiratory System" and partly with "Ill-defined and not specified Causes."
† Deaths from these diseases prior to 1881 were classed with "Other Tubercular and Scrofulous Diseases."

TABLE 16.—ENGLAND.—**Annual Death-rates,** from **Various Causes,** to a **Million Persons living, 1865–89.**

(Decimals are omitted, the nearest whole number being taken. When the Deaths from any Cause were too few to give a rate of 0·5, a cipher is inserted.)

* The Populations of the counties have been estimated to the middle of 1889 from the numbers enumerated at the Censuses in 1871 and 1881.

TABLE 21.—ENGLAND.—Death-rates of Persons, Males, and Females, from various Causes, 1889.

CAUSE OF DEATH.	Deaths to 1,000,000 living. Persons.	Males.	Females.
ALL CAUSES - -	17865	18846	16934
Small-pox - - - -	1	1	1
Chicken-pox - - -	3	3	3
Measles - - - -	508	546	471
Epidemic Rose Rash -	5	6	4
Scarlet Fever - - -	231	237	225
Typhus - - - -	5	6	4
Relapsing Fever - -	0	0	0
Influenza - - - -	2	2	2
Whooping-cough - -	421	398	443
Mumps - - - -	3	4	2
Diphtheria - - -	185	173	196
Cerebro-spinal Fever -	1	1	1
Simple and Ill-defined Fever - - - -	14	13	16
Enteric Fever - - -	173	184	162
Other Miasmatic Diseases	0	0	0
Cholera - - - -	11	12	10
Diarrhœa, Dysentery -	635	689	584
Remittent Fever - -	3	3	2
Ague - - - - -	3	4	2
Hydrophobia - - -	1	2	1
Glanders - - - -	0	0	0
Splenic Fever - - -	0	0	0
Cow-pox and other Effects of Vaccination - -	2	2	2
Syphilis - - - -	71	76	66
Gonorrhœa, Stricture of Urethra - - - -	9	19	0
Phagedæna - - -	2	1	2
Erysipelas - - -	41	42	41
Pyæmia, Septicæmia -	11	12	10
Puerperal Fever - -	64	-	124
Thrush - - - -	19	22	17
Other Dis. from Vegetable parasites - - -	0	0	0
Hydatid Disease - -	2	1	2
Other Dis. from Animal parasites - - -	4	3	4
Starvation, Want of Breast Milk - - - -	11	12	9
Scurvy - - - -	1	1	1
Intemperance: Chron. Alcoholism	41	49	34
Intemperance: Delirium Tremens	13	22	4
Rheumatic Fever, Rheumatism of Heart - -	78	80	76
Rheumatism - - -	31	29	32
Gout - - - - -	19	31	7
Rickets - - - -	33	38	29
Cancer - - - -	643	488	790
Tabes Mesenterica - -	263	285	243
Tubercular Meningitis (Acute Hydrocephalus) -	229	259	201
Phthisis - - - -	1542	1679	1413
Other Forms of Tuberculosis, Scrofula - -	179	193	166
Purpura, Hæmorrhagic Diathesis - -	13	14	12
Anæmia, Chlorosis, Leucocythæmia - - -	49	38	60
Diabetes Mellitus - -	60	69	52
Other Constitutional Dis.	19	14	24
Premature Birth - -	498	574	425
Atelectasis - - -	26	32	20
Cyanosis - - - -	33	39	28
Spina Bifida - - -	21	20	22
Imperforate Anus - -	6	9	4
Cleft Palate, Harelip -	7	8	6
Other Congenital Defects	11	12	10
Old Age - - - -	918	798	1032

CAUSE OF DEATH.	Deaths to 1,000,000 living. Persons.	Males.	Females.
Inflammation of Brain or its Membranes - -	295	324	267
Apoplexy - - - -	549	516	581
Softening of Brain - -	114	128	100
Hemiplegia, Brain Paralysis	293	279	306
Paralysis Agitans - -	7	8	7
Insanity, General Paralysis of Insane - - -	95	124	68
Chorea - - - -	3	2	5
Epilepsy - - - -	100	106	95
Convulsions - - -	742	863	625
Laryngismus Stridulus -	23	31	16
Idiopathic Tetanus - -	2	2	1
Paraplegia, Diseases of Spinal Cord - - -	65	78	54
Other Diseases of Nervous System - - - -	135	150	121
Otitis, Otorrhœa - -	18	22	14
Epistaxis and Diseases of Nose - - - -	3	3	3
Ophthalmia and Diseases of Eye - - - -	3	3	2
Endocarditis, Valvular Dis.	264	254	274
Pericarditis - - -	15	18	12
Hypertrophy of Heart -	11	11	10
Angina Pectoris - -	23	30	17
Syncope - - - -	64	67	62
Aneurism - - - -	28	45	13
Senile Gangrene - -	49	58	41
Embolism, Thrombosis -	37	29	45

1870 -	195,962	4,523	23·1	1889 -	230,263	3,018	13·1

NOTE.—*Up to and including* 1886 masters were excluded from the above employment and mortality figures; the latter of which contained some cases of men who died in colonial vessels and fishing vessels not registered under the Merchant Shipping Acts, whose crews are not included in the employment column.

Since 1886 masters are included in both columns, and the employment and mortality figures relate only to persons employed in registered vessels belonging to the United Kingdom, the Isle of Man, and Channel Islands.

---

* The prices of Consols for the years 1840–52 relate to the 12 months beginning 1st April; from 1853 onwards the prices relate to calendar years. For the years 1840–88 the prices relate to stock bearing 3 per cent. interest, for 1889 to stock bearing 2¾ per cent.

† From the Board of Trade Statistical Abstract.

‡ The prices of coal are derived from Parliamentary Returns furnished by the Registrar of the London Coal Market, by order of the House of Commons.

§ Derived from Returns, published by the Local Government Board, of the number of persons in receipt of Relief on the last day of each week.

NOTE.—An addition of territory containing a population of about 8000 was made in 1864, and the facts relating thereto are included in this Table from 1860. Previously to 1st January 1860, children who died within 24 hours after birth were counted as still-born.

* Census year.

† Cholera was epidemic in the year 1853, and war raged in the years 1850 and 1864.

NOTE.—The population in the four years 1862–65 and in the years 1867–69 is estimated by means of the average annual rate of increase observed between the two enumerations of 1861 and 1866. The deaths of Frenchmen abroad, civil or military, are registered in the books of the Commune in which they were last domiciled.

* Census year.

† Cholera prevailed in 1865–66, and war raged in 1870 and 1871.

1884	17,193,689	115,470	230,940	637,052	535,256	13·4	37·1	31·1

NOTE.—Statistics for the 7 years 1871-77 were not issued owing to the disturbed state of the country. The decline in registered marriages in 1870 is believed to be due to the introduction of civil registration, which occurred in that year.

* Censuses were taken on 31st December 1860, 1866, and 1877.

NOTE.—The numbers for Rome were first included with those for the Kingdom of Italy in 1872. The population figures given for census years show the numbers enumerated on 31st December in each of those years; whereas for each of the other years the population is estimated to the middle of the year. The populations in inter-census years are somewhat over-estimated, no account having been taken of emigration.

* Census year.

Table 57.—ENGLAND. **Changes** in the **Constitution** of **Registration Districts** and **Sub-districts** during the Year **1889.**

N.B.—(1.) The Name of the District is in Small Capitals, that of the Sub-district in *Italics.*
(2.) The Populations quoted are the Numbers enumerated at the Census of 1881.

No. of District.	Name of Registration District.	*Date of Change.	Nature of Change.
16	Bethnal Green -	1889. 1 October -	The four sub-districts of *Hackney Road, Green, Church,* and *Town* were dissolved and the district re-arranged as follows, viz.:—*Bethnal Green North* sub-district consists of that portion of the parish situate north of Bethnal Green Road and west of Cambridge Road, including the north side of Bethnal Green Road (aggregate population 51,157); *Bethnal Green South* sub-district consists of that portion of the parish situate south of Bethnal Green Road and west of Cambridge Road, including the south side of Bethnal Green Road (aggregate population 34,399); and *Bethnal Green East* sub-district comprises both sides of Cambridge Road and all that portion of the parish to the east of it (aggregate population 41,405).
303	Williton - -	1 May -	The parish of West Quantoxhead (population 278) was transferred from the sub-district of *Stogumber* to that of *Williton.*
377	Tenbury - -	1 May -	The sub-districts of *Tenbury* and *Bockleton* were united under the name of *Tenbury* (population 7,588).
387	Aston - - -	1 April -	That part of the parish of Aston forming the parliamentary borough of Aston Manor, which was formerly included in *Erdington* sub-district, was constituted a separate sub-district, and named *Aston Manor* (population 53,842).
431	Nottingham - -	1 April -	The sub-districts of *Lenton* and *Park* were united under the name of *Lenton* (population 25,483).
496	Halifax - -	1 April -	That part of the parish of Skircoat which is situated in Sowerby Bridge Local Board District (population 2,538), was transferred from the sub-district of *Halifax* to that of *Sowerby.*
595	Llandovery - -	1 January -	The sub-districts of *Llansadwrn* and *Conwil Cayo* were united under the name of *Conwil Cayo* (population 3481).
595	Llandovery - -	1 April -	The parishes of Llansadwrn and Llanwrda (aggregate population 1502) were separated from the sub-district of *Conwil Cayo* and constituted a separate sub-district under the name of *Llansadwrn.* The effect of this change is to restore the arrangement of the district existing prior to 1st January 1889 (*see* above).

Under the provisions of "The Divided Parishes and Poor Law Amendment Acts, 1876 and 1879," changes were made on the 24th March 1889 in the constitution of the following Districts, viz.:—Maidstone (50), Hollingbourn (51), East Ashford (55), Bridge (56), Petworth (80), Midhurst (85), Isle of Wight (91*), Winchester (101), Alresford (105), Bradfield (118), Reading (119), Wokingham (120), Woodstock (152), Banbury (155), Orsett (190*), Billericay (191), Chelmsford (192*), Maldon (194*), Lexden (197*), Braintree (199*), Dunmow (200*), Basford (430), Bingham (434), Belper (437), Ashborne (438), Northwich (447), Congleton (448), Chorlton (464), Ashton-under-Lyne (468), Rothbury (567*), Bangor (628), and Holyhead (630b).

---

* In these cases the limits of the sub-districts only are affected.

* The *Registration Counties* consist of groups of Registration Districts, which are generally co-extensive with the Poor Law Unions. A District which extends into two or more Geographical Counties is included entirely in that Registration County in which the principal town of the District, or the greater part of the population, is located. The boundaries of the Registration Counties differ therefore more or less from the boundaries of the Geographical Counties. For areas and populations of the Registration Divisions and Counties, *see pages 64-67.*

* The 632 *Registration Districts* (Paddington 1a and Holyhead 630b having been constituted Registration Districts since the numerical arrangement 1 to 630 was adopted on 1st January 1881) are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births, Deaths, and Marriages, and are nearly always identical with the Poor Law Unions of the same names; they are arranged, according to the local position, under the Registration Counties. The Registration Sub-districts (2128 in number at the end of the year 1888) are sub-divisions of Registration Districts, within which the Births and Deaths are registered by Registrars severally appointed for that purpose. The letter *W* denotes that the Sub-district contains within its limits a Workhouse Establishment belonging to the District or Union; *w* indicates that a Workhouse Establishment receiving inmates from other Districts than the one in which it stands is included; *H* indicates a Hospital or Infirmary; *L* a Lunatic Asylum; and repetitions of these letters show the number of such Institutions in each Registration sub-district.

† The Deaths in the principal Institutions in England in 1889 are given on pages 71-94.

DEATHS IN WORKHOUSES, HOSPITALS, AND PUBLIC LUNATIC ASYLUMS.

1889.

THE following Table shows the numbers of deaths (Persons, Males, and Females) registered during 1889 in the Workhouses, Hospitals, and Public Lunatic Asylums of England. These figures afford the means of correcting the mortality of districts and sub-districts in which these Institutions are situated. The Table includes 1786 Institutions; of which 737 are Workhouses, Workhouse Infirmaries, or Workhouse Schools; 959 Hospitals or Infirmaries; and 90 Lunatic Asylums. The Lunatic Asylums are mostly County Asylums, but a few private Asylums which receive pauper patients (held on that account to be public for the purposes of this Table) are also included. In these 1786 Institutions 58,238 deaths were registered during the year, or 11·2 per cent. of the total deaths in England and Wales, against 10·8 and 11·4 per cent. in the two preceding years; 34,307 occurred in Workhouses, 18,140 in Hospitals, and 5791 in Lunatic Asylums. The proportion to total deaths was 6·6 per cent. in Workhouses, 3·5 in Hospitals, and 1·1 in Lunatic Asylums. The proportion of deaths recorded in Workhouses, which had been 6·5 and 6·9 per cent. in 1887 and 1888, declined to 6·6 per cent. in 1889.

Information relating to the deaths recorded in many Private Lunatic Asylums, Private Asylums for Idiots and Imbeciles, and in a few other institutions, will be found in the notes to the following pages.

Deaths in Workhouses, Hospitals, and Public Lunatic Asylums, 1889.

* In this classification of Violent Deaths the totals of the sub-divisions Burns, Scalds, &c., Drowning, and Suffocation, necessarily differ from the totals of the headings bearing similar names in the classification of Causes of Death on pp. 120, 121, as the classification here takes account of the cause of the injury, and there only of the nature of the injury.

ENGLAND.—DEATHS from ACCIDENT and NEGLIGENCE at different Periods of Life, in the Year 1889—

---

* The deaths of 22 males from Hydrophobia in the year are classed under Zoogenous Diseases in the Table of Causes of Death (*see* p. 112).
† When a person dies from an operation, performed on account of any disease or injury the nature of which is stated in the certificate, the death is classed under that disease or injury.

OF the above 10,790 ACCIDENTS, 131 are stated to have occurred to Men in a state of INTOXICATION, and 4 to Men suffering from DELIRIUM TREMENS. And in 255 other cases Death was accelerated by the supervention of ERYSIPELAS, MORTIFICATION, PYÆMIA, or TETANUS. Here follow the details:—

CAUSES INDUCING OR ACCELERATING DEATHS FROM ACCIDENT.		ALL AGES.	Total under 1 Year.																	
			Infants under 1 Month.	Others.	1–	2–	3–	4–	Total under 5 Years.	5–	10–	15–	20–	25–	35–	45–	55–	65–	75–	85 and upwards.

* The deaths of 8 females from Hydrophobia in the year are classed under Zoogenous diseases, in the Table of Causes of Death (*see* p. 113.)

† When a person dies from an operation performed on account of any disease or injury the nature of which is stated in the certificate, the death is classed under that disease or injury.

OF the above 4235 ACCIDENTS, 60 are stated to have occurred to Women in a state of INTOXICATION. And in 66 other cases Death was accelerated by the supervention of ERYSIPELAS, MORTIFICATION, PYÆMIA, or TETANUS.* Here follow the details:—

CAUSES INDUCING OR ACCELERATING DEATHS FROM ACCIDENT.		ALL AGES.	Total under 1 Year. Infants under 1 Month.	Others.	1–	2–	3–	4–	Total under 5 Years.	5–	10–	15–	20–	25–	35–	45–	55–	65–	75–	85 and upwards.
Intoxication at time of Accident		60	-	-	-	-	-	-	-	-	-	1	-	8	18	19	10	4	-	-
Acceleration by	Erysipelas	10	-	-	-	-	-	-	-	-	-	-	-	-	1	1	5	1	1	1
	Mortification	5	-	-	-	-	-	-	-	-	-	1	1	-	1	-	-	-	1	1
	Pyæmia	35	-	-	-	2	-	1	3	3	5	-	1	3	6	4	4	3	3	-
	Tetanus*	16	-	-	-	-	-	-	-	3	1	-	1	4	3	1	2	1	-	-

* Cases of Tetanus which are not stated to be the result of injury are classed as "Idiopathic Tetanus" in the Table of Causes of Death (*see* page 115).

INDEX OF REGISTRATION DISTRICTS.

The following Index furnishes a reference to the *Number* of each REGISTRATION DISTRICT in the topographical arrangement adopted in the Tables of Abstracts contained in the Report.* The alphabetical arrangement places compound names in the order in which they are pronounced: thus, East Ashford will be found under the letter E, and *not* under A.

In consequence of numerous alterations (amalgamations of districts and formations of new districts) since the numerical arrangement, 1 to 623, was adopted in the Abstracts for the year 1847, the districts were re-numbered consecutively from 1 to 630 in the Abstracts for the year 1881. Since that date two new Registration Districts have been formed, the District of Kensington (1) having been divided into Paddington (1*a*) and Kensington (1*b*), and the District of Anglesey (630) into Anglesey (630*a*) and Holyhead (630*b*).

For names of Towns, such as Leamington, Torquay, &c., which are not found in this "Index of Registration Districts," see the "Index of Registration Sub-districts" (pp. 208-217) *and "Index of certain Towns"* (pp. 218, 219).

INDEX OF REGISTRATION SUB-DISTRICTS.

[This alphabetical arrangement places the Registration Sub-Districts (or Registrars' Districts) having *compound names* in the order indicated by the usual pronunciation of those names; thus, East Grinstead will be found under the letter E, and not under G; St. James under the letter S, and not as "James, St." The number against each Sub-District, in the third column, refers to its numerical place in the Tables of Abstracts; thus, Abbey Holme (573; 2) is the 2d Sub-District of the Wigton District, No. 573.]

SUB-DISTRICT.	DISTRICT.	NO.
A		
Abbey Holme	Wigton	573; 2
Abbots Bromley	Uttoxeter	366; 2
Abbotsbury	Weymouth	264; 4
Abbots Langley	Watford	137; 4

GENERAL INDEX

TO

REGISTRAR-GENERAL'S FIFTY-SECOND ANNUAL REPORT (1889).

PAGES

Accident; Mortality from (Abstracts, pp. 121–199) xviii

Ages; Mean, at Marriage and Re-marriage, 1889 vii
  at Death. (Tables 11–14, pp. xxxvii–xl) ix
  of 411,606 Persons married in 1889, distinguishing previous Civil Condition 68–70
  at Death, of each sex, in Divisions and Counties, 1889 . . . 96–105
    (*See also* Death Rates.)

Area of United Kingdom and its parts. Table 1.) . . . . . xxvii, xxviii
  of Town and Country Districts in England and Wales. (Table 25.) . liv
  of Islands in the British Seas. (Table 27.) lv
  of each District and Sub-district in England and Wales . . . 4–63
  of each Division and County in England and Wales . . . 64, 66

Army, The; Strength and Mortality of. (Table 29, p. lvii.) . . . xix

Australian Colonies and New Zealand; English Emigrants to. (Table 28.) lvi

Austria; Population, Marriages, Births, and Deaths. (Tables 39, 47.) . lxvi, lxxi

Bankers' Clearing House, 1868–89. (Table A.) vi

Belgium; Population, Numbers and Proportion of Marriages, Births, and Deaths. (Tables 39, 53.). . . . . lxvi, lxxv

Births in England and Wales, 1889. (Abstracts, pp. 2–63.) viii
  Illegitimate. (Abstracts, pp. 2–63.) viii
  Sex proportions. (Tables 2, p. xxix, 10, p. xxxvi.) viii
  Premature; increasing mortality ascribed to xviii
  Aggregate Number of Names on Registers, 1840–89. (Table 26.) lv
  in Islands in the British Seas. (Table 27.) lvi
  of British Subjects at Sea. (Table 32, p. lviii.) xx
    (*See also* Marine Register Book.)
  in United Kingdom and its parts, and in other European States. (Tables 40–56.) . . . . lxvii–lxxvii

Birth-rates; Total, Legitimate, and Illegitimate. (Tables 2, p. xxix, 3, 4, p. xxx, 10, p. xxxvi.) viii
  in United Kingdom and its parts, and in other European States. (Tables 39–56) . . . . lxvi–lxxvii

Cancer; its increase considered with regard to Sex and parts affected. (Tables D, E.) . . . . xiii–xviii

PAGES

CAUSES OF DEATH; Mortality from the several Classes of. (Table C.) . x–xviii
(*See* DEATHS, DEATH-RATES, CERTIFICATION, and ILL-DEFINED and NOT SPECIFIED CAUSES.)

CENTENARIANS; Deaths of Persons returned as, in 1889 x

CERTIFICATES of Marriages, Births, and Deaths issued in 1889 . . . xix

CERTIFICATION of Causes of Death xix

CHANGES in Constitution of Registration Districts in 1889. (Table 57.) . lxxviii

CHILDBIRTH and Puerperal Fever, Mortality from, in Counties, 1879–88 and 1889. (Table 23) liii

COAL; prices of, 1838–89. (Table 38.) lxv

CONSOLS; prices of, 1838–89. (Table 38.) lxv

CONSTITUTIONAL DISEASES; Mortality ascribed to. (Table B., p. x.) . xiii

CONTINUED FEVER; continued low mortality from xi

COUNTRY DISTRICTS; Mortality in. (Tables 24, 25, p. liv.) x

DEATHS; in England and Wales, 1889 (Abstracts, pp. 2–63) viii
from various Causes in England and Wales. (Table 15, pp. xli, xlii.) . . . . x–xviii
Certification of Causes of xviii
of British Subjects at Sea. (Tables 31, 32, lviii.) xx
(*See also* MARINE REGISTER BOOK.)
Proportional Number from various Causes to a 1,000,000 Deaths from all Causes, 1889. (Table 22.) lii
Aggregate Number of Names on Registers, 1840–89. (Table 26.) lv
in Islands in the British Seas. (Table 27.) lvi
in United Kingdom and its Parts, and in other European States. (Tables 40–56.) . . . . lxvii–lxxvii
in Public Institutions 71–94
in Divisions and Counties, classified according to sex and age . 96–105
in England and Wales, classified according to sex, age, and cause . 108–121
in London, classified according to sex, age, and cause . . . 122–135
in Registration Counties, classified according to sex and cause . 136–159
from several causes in Divisions, Counties, and Districts . . 160–192
in England and Wales from Accident, Suicide, Murder, and Manslaughter, distinguishing method, sex, and age . . . 193–205

DEATH-RATES; in 1889 viii
in Counties viii
of Males and Females compared vii
in groups of ages. Table B. (Tables 11–14, pp. xxxvii–xl.) . ix
in Counties and in Urban and Rural Districts. (Tables 10, 24, 25, pp. xxxvi, liv.) x
from Classes of Causes. (Table C., p. x.) . . . . . x–xviii
from Cancer at successive age periods. Table D. xv
from Cancer at 35 years and upwards, distinguishing parts affected. Table E. xvi
in Army and Navy in series of years. (Tables 29, 30, p. lvii.) . xix–xx
in United Kingdom and its parts, and in other European States. (Tables 39–56, pp. lxvi–lxxvii.) xx
in years 1838–89, in groups of years, and in quarters. (Tables 2, 3, 4.) . . . . xxix–xxx
from various Causes in England and Wales, 1865–89, and in groups of years. (Tables 16, 17.) . . . . xliii–xlv

PAGES

DEATH-RATES—*continued.*
from the Principal Zymotic Diseases in England and Wales, 1838–89. (Table 18.) xlvii
from the Principal Zymotic Diseases in London, 1838–89. (Table 19.) xlviii
from several Causes, in Counties, 1889. (Table 20.) . . . . xlix–l
of Persons, Males, and Females, 1889, classified according to Cause. (Table 21.) li
from Measles, Scarlet Fever, Fever, Whooping-cough, and Puerperal Fever in Counties, 1879–88 and 1889. (Table 23.) . liii
(*See also* INFANT MORTALITY.)

DENMARK; Population, Numbers, and Proportions of Marriages, Births, and Deaths. (Tables 39, 44.) . . . . lxvi, lxix

DENSITY OF POPULATION; Persons to a square Mile, 1851–89. (Table 24.) liv
